The information provided in this documentation contains general descriptions and/or technical characteristics of the performance of the products contained herein. This documentation is not intended as a substitute for and is not to be used for determining suitability or reliability of these products for specific user applications. It is the duty of any such user or integrator to perform the appropriate and complete risk analysis, evaluation and testing of the products with respect to the relevant specific application or use thereof. Neither Schneider Electric nor any of its affiliates or subsidiaries shall be responsible or liable for misuse of the information contained herein. If you have any suggestions for improvements or amendments or have found errors in this publication, please notify us.

You agree not to reproduce, other than for your own personal, noncommercial use, all or part of this document on any medium whatsoever without permission of Schneider Electric, given in writing. You also agree not to establish any hypertext links to this document or its content. Schneider Electric does not grant any right or license for the personal and noncommercial use of the document or its content, except for a non-exclusive license to consult it on an "as is" basis, at your own risk. All other rights are reserved.

All pertinent state, regional, and local safety regulations must be observed when installing and using this product. For reasons of safety and to help ensure compliance with documented system data, only the manufacturer should perform repairs to components.

When devices are used for applications with technical safety requirements, the relevant instructions must be followed.

Failure to use Schneider Electric software or approved software with our hardware products may result in injury, harm, or improper operating results.

Failure to observe this information can result in injury or equipment damage.

# Safety Information

## Important Information

### NOTICE

Read these instructions carefully, and look at the equipment to become familiar with the device before trying to install, operate, service, or maintain it. The following special messages may appear throughout this documentation or on the equipment to warn of potential hazards or to call attention to information that clarifies or simplifies a procedure.

The addition of this symbol to a “Danger” or “Warning” safety label indicates that an electrical hazard exists which will result in personal injury if the instructions are not followed.

This is the safety alert symbol. It is used to alert you to potential personal injury hazards. Obey all safety messages that follow this symbol to avoid possible injury or death.

### **DANGER**

**DANGER** indicates a hazardous situation which, if not avoided, **will result in** death or serious injury.

### **WARNING**

**WARNING** indicates a hazardous situation which, if not avoided, **could result in** death or serious injury.

### **CAUTION**

**CAUTION** indicates a hazardous situation which, if not avoided, **could result in** minor or moderate injury.

### **NOTICE**

**NOTICE** is used to address practices not related to physical injury.

---

## PLEASE NOTE

Electrical equipment should be installed, operated, serviced, and maintained only by qualified personnel. No responsibility is assumed by Schneider Electric for any consequences arising out of the use of this material.

A qualified person is one who has skills and knowledge related to the construction and operation of electrical equipment and its installation, and has received safety training to recognize and avoid the hazards involved.

## BEFORE YOU BEGIN

Do not use this product on machinery lacking effective point-of-operation guarding. Lack of effective point-of-operation guarding on a machine can result in serious injury to the operator of that machine.

### WARNING

#### UNGUARDED EQUIPMENT

- Do not use this software and related automation equipment on equipment which does not have point-of-operation protection.
- Do not reach into machinery during operation.

**Failure to follow these instructions can result in death, serious injury, or equipment damage.**

This automation equipment and related software is used to control a variety of industrial processes. The type or model of automation equipment suitable for each application will vary depending on factors such as the control function required, degree of protection required, production methods, unusual conditions, government regulations, etc. In some applications, more than one processor may be required, as when backup redundancy is needed.

Only you, the user, machine builder or system integrator can be aware of all the conditions and factors present during setup, operation, and maintenance of the machine and, therefore, can determine the automation equipment and the related safeties and interlocks which can be properly used. When selecting automation and control equipment and related software for a particular application, you should refer to the applicable local and national standards and regulations. The National Safety Council's Accident Prevention Manual (nationally recognized in the United States of America) also provides much useful information.

In some applications, such as packaging machinery, additional operator protection such as point-of-operation guarding must be provided. This is necessary if the operator's hands and other parts of the body are free to enter the pinch points or other hazardous areas and serious injury can occur. Software products alone cannot protect an operator from injury. For this reason the software cannot be substituted for or take the place of point-of-operation protection.

Ensure that appropriate safeties and mechanical/electrical interlocks related to point-of-operation protection have been installed and are operational before placing the equipment into service. All interlocks and safeties related to point-of-operation protection must be coordinated with the related automation equipment and software programming.

---

**NOTE:** Coordination of safeties and mechanical/electrical interlocks for point-of-operation protection is outside the scope of the Function Block Library, System User Guide, or other implementation referenced in this documentation.

## START-UP AND TEST

Before using electrical control and automation equipment for regular operation after installation, the system should be given a start-up test by qualified personnel to verify correct operation of the equipment. It is important that arrangements for such a check be made and that enough time is allowed to perform complete and satisfactory testing.

### **WARNING**

#### **EQUIPMENT OPERATION HAZARD**

- Verify that all installation and set up procedures have been completed.
- Before operational tests are performed, remove all blocks or other temporary holding means used for shipment from all component devices.
- Remove tools, meters, and debris from equipment.

**Failure to follow these instructions can result in death, serious injury, or equipment damage.**

Follow all start-up tests recommended in the equipment documentation. Store all equipment documentation for future references.

**Software testing must be done in both simulated and real environments.**

Verify that the completed system is free from all short circuits and temporary grounds that are not installed according to local regulations (according to the National Electrical Code in the U.S.A, for instance). If high-potential voltage testing is necessary, follow recommendations in equipment documentation to prevent accidental equipment damage.

Before energizing equipment:

- Remove tools, meters, and debris from equipment.
- Close the equipment enclosure door.
- Remove all temporary grounds from incoming power lines.
- Perform all start-up tests recommended by the manufacturer.

---

## OPERATION AND ADJUSTMENTS

The following precautions are from the NEMA Standards Publication ICS 7.1-1995 (English version prevails):

- Regardless of the care exercised in the design and manufacture of equipment or in the selection and ratings of components, there are hazards that can be encountered if such equipment is improperly operated.
- It is sometimes possible to misadjust the equipment and thus produce unsatisfactory or unsafe operation. Always use the manufacturer's instructions as a guide for functional adjustments. Personnel who have access to these adjustments should be familiar with the equipment manufacturer's instructions and the machinery used with the electrical equipment.
- Only those operational adjustments actually required by the operator should be accessible to the operator. Access to other controls should be restricted to prevent unauthorized changes in operating characteristics.

## At a Glance

### Document Scope

This manual is a reference document for the 800 series I/O modules with Control Expert.

The manual provides an overview, keying and wiring information, specifications, and parameter configuring information for four types of modules:

- RIO drop
- analog
- discrete
- special purpose

The manual displays both 984LL and IEC notation, but most module descriptions use 984LL notation. Conversion charts appear in the first chapters.

- Converting Direct Address Notation (*see page 604*)
- Flat Addressing (*see page 606*)

Users should be familiar with automation controls and be qualified to install and operate automation equipment.

Module availability:

- Some modules may no longer be available for sale.
- For the status of particular modules, please contact your local sales office.
- To locate a sales office,
  - a. Visit <http://www.schneider-electric.com>
  - b. Select your country in the drop-down menu.

### Validity Note

This documentation is valid for EcoStruxure™ Control Expert 14.0 or later.

The technical characteristics of the devices described in the present document also appear online. To access the information online:

# Part I

## 800 Series I/O Modules

---

### Overview

This part provides a global overview of the 800 series I/O modules and describes generic features common to all modules.

### What Is in This Part?

This part contains the following chapters:

| Chapter | Chapter Name                   | Page |
|---------|--------------------------------|------|
| 1       | 800 Series I/O Module Overview | 23   |
| 2       | 800 Series I/O Modules         | 29   |

---

# Chapter 1

## 800 Series I/O Module Overview

---

### 800 Series I/O Modules - Technical Data Summary

#### Introduction

The following tables provide an overview of the technical features for all series 800 I/O.

- RIO interface modules
- analog I/O modules
- discrete I/O modules
- special purpose I/O modules

#### RIO Interface Modules

| Module | Type             |
|--------|------------------|
| J890   | Drop Interface   |
| J892   | Drop Interface   |
| P890   | Direct Interface |
| P892   | Direct Interface |

#### Analog Modules

The following table summarizes the technical data of the 800 series analog I/O modules:

| Module   | Type | Range      | Channels | Remarks                                                                                                                               |
|----------|------|------------|----------|---------------------------------------------------------------------------------------------------------------------------------------|
| B846-001 | In   | 0-5 V      | 16       | Reed-Relay-Multiplexer for voltage input as front end for B873/875 A/D converter.<br><br>1 Word (Bin)                                 |
|          |      | 1-5 V      |          |                                                                                                                                       |
|          |      | +/- 10 V   |          |                                                                                                                                       |
| B846-002 | In   | 4-20 mA    | 16       | Reed-Relay-Multiplexer for current input (Input impedance 250 $\Omega$ ) as front end for B873/875 A/D converter.<br><br>1 Word (Bin) |
| B872-100 | Out  | 4-20 mA    | 4        | User supply required.                                                                                                                 |
| B872-200 | Out  | 0-5 VDC    | 4        | Operating range selectable per channel.<br><br>No user supply required.                                                               |
|          |      | 0-10 VDC   |          |                                                                                                                                       |
|          |      | +/- 5 VDC  |          |                                                                                                                                       |
|          |      | +/- 10 VDC |          |                                                                                                                                       |

| Module   | Type | Range      | Channels                    | Remarks                                              |
|----------|------|------------|-----------------------------|------------------------------------------------------|
| B873-002 | In   | 1-5 VDC    | 4                           | 4 Words (Bin)                                        |

|          |      | RTD/TC     |                             |                                                      |
|          |      | 0 - 10 V   |                             |                                                      |
|          |      | 0 - 20 mA  |                             |                                                      |

## Discrete Modules

The following table summarizes the technical data for the discrete modules:

| Module   | Type | Range                       | Channels | Remarks                   |
|----------|------|-----------------------------|----------|---------------------------|
| B802-008 | Out  | 80 - 130 Vac cont.          | 8        | Individually isolated     |
|          |      | 47 - 63 Hz                  |          |                           |
| B803-008 | In   | 80 - 130 Vac cont.          | 8        | Individually isolated     |
|          |      | 47 - 63 Hz                  |          |                           |
| B804-116 | Out  | 80 - 130 Vac cont.          | 16       | Isolated                  |
|          |      | 47 - 63 Hz                  |          | 2 groups, 8 points/group  |
| B804-148 | Out  | 40 - 56 Vac                 | 16       | Isolated                  |
|          |      | 47 - 63 Hz                  |          | 2 groups, 8 points/group  |
| B805-016 | In   | 80 - 130 Vac cont.          | 16       | Isolated                  |
|          |      | 47 - 63 Hz                  |          | 2 groups, 8 points/group  |
| B806-032 | Out  | 80 - 130 Vac cont.          | 32       |                           |
|          |      | 47 - 63 Hz                  |          |                           |
| B806-124 | Out  | 20 - 28 Vac cont.           | 32       | 2 groups, 16 points/group |
|          |      | 47 - 63 Hz                  |          |                           |
|          |      | 32 Vac RMS max.<br>for 10 s |          |                           |
| B807-132 | In   | 80 - 130 Vac cont.          | 32       | 4 groups, 8 points/group  |
|          |      | 47 - 63 Hz                  |          |                           |
| B808-016 | Out  | 180 - 260 Vac               | 16       | 2 groups, 8 points/group  |
|          |      | 47 - 63 Hz                  |          |                           |
| B809-016 | In   | 160 - 260 Vac               | 16       | 2 groups, 8 points/group  |
|          |      | 47 - 63 Hz                  |          |                           |
| B810-008 | Out  | 80 - 130 Vac cont.          | 8        | Isolated                  |
|          |      | 47 - 63 Hz                  |          |                           |
| B814-108 | Out  | 0 - 30 Vdc                  | 8        | Relay                     |
|          |      | 0 - 240 Vac                 |          |                           |
|          |      | 47 - 63 Hz                  |          |                           |
| B817-116 | In   | 115 Vac                     | 16       | Isolated                  |
| B817-216 | In   | 230 Vac                     | 16       | Isolated                  |
| B820-008 | Out  | 10 - 60 Vdc                 | 8        | True high                 |
| B821-108 | In   | 10 - 60 Vdc                 | 8        | True high                 |
| B824-016 | Out  | 20 - 28 Vdc                 | 16       | True high                 |

| Module   | Type | Range               | Channels | Remarks                  |
|----------|------|---------------------|----------|--------------------------|
| B825-016 | In   | 20 - 28 Vdc         | 16       | True high                |
| B827-032 | In   | 18 - 30 Vdc         | 32       | True high                |
| B828-016 | Out  | 5 V TTL             | 16       |                          |
| B829-116 | In   | 5 V TTL             | 16       | High speed TTL           |
| B832-016 | Out  | 20 - 28 Vdc         | 16       | True low                 |
| B833-016 | In   | 20 - 28 Vdc         | 16       | True low                 |
| B836-016 | Out  | 12 - 250 Vdc        | 16       | Isolated                 |
| B837-016 | In   | 20.4 - 27 Vac       | 16       | Isolated                 |
|          |      | 47 - 63 Hz          |          | 2 groups, 8 points/group |
|          |      | 19.2 - 30 Vdc       |          |                          |
| B838-032 | Out  | 20 - 30 Vdc         | 32       | True high                |
| B840-108 | Out  | 0 - 300 Vdc max.    | 8        | Relay                    |
|          |      | 0 - 230 Vac max.    |          |                          |
|          |      | 47 - 63 Hz          |          |                          |
| B846-001 | In   | 0 - 5 V             | 16       | 1 word out (BIN)         |
|          |      | 1 - 5 V             |          |                          |
|          |      | ±10 V               |          |                          |
| B846-002 | In   | 4-20 mA             | 16       | 1 word out (BIN)         |
| B849-016 | In   | 41 - 53 Vac         | 16       |                          |
|          |      | 47 - 63 Hz          |          |                          |
|          |      | 39 - 58 Vdc         |          |                          |
| B853-016 | In   | 80 - 130 Vac        | 16       | True high                |
|          |      | 47 - 63 Hz          |          |                          |
|          |      | 85 - 150 Vdc        |          |                          |
| B855-016 | In   | 11.4 - 12.6 Vdc     | 16       | Isolated                 |
| B863-032 | In   | 18-30 Vdc true high | 32       |                          |
|          |      | 24 Vdc nominal      |          |                          |
| B863-132 | In   | 0 - 30 Vdc          | 32       |                          |
| B864-001 | Out  |                     | 8        | 8 channel reg. mux       |
| B865-001 | In   | 5 V TTL             | 8        | 8 channel reg. mux       |
| B881-001 | In   | 20 - 28 Vdc         | 16       |                          |
| B881-508 | Out  | 5 - 140 Vdc max.    | 8        |                          |
| B882-032 | Out  | 19.2 - 28 Vdc       | 32       |                          |
| B882-116 | Out  | 19.2 - 30 Vdc       | 16       |                          |

## Special Purpose Modules

The following table displays a summary of the technical data for the special purpose modules:

| Module   | Type               | Range      | Channels | Remarks             |
|----------|--------------------|------------|----------|---------------------|
| B882-239 | High Speed Counter | 30 kHz     |          | 4 inputs            |
|          |                    | 350 Hz     |          | 3 outputs           |
| B883-001 | High Speed Counter | 50 kHz     | 2        | 3 outputs           |
| B883-101 | CAM                | 4          | -        | -                   |
| B883-200 | Thermocouple Input | Centigrade | 10 In    | Open circuit detect |
|          |                    | Fahrenheit |          | Self-calibrated     |
|          |                    | millivolts |          |                     |
| B883-201 | RTD Input          | Centigrade | 8        | European            |
|          |                    | Fahrenheit |          | American            |
|          |                    |            |          | Linear              |
| B884-002 | PID Loop           | N/A        | 2        | Open/closed loop    |
| B885-002 | ASCII/BASIC        | N/A        | 2        | RS232               |
|          |                    |            |          | RS422               |

---

# Chapter 2

## 800 Series I/O Modules

---

**Purpose**

This chapter describes the general features, configuration, and operation of the 800 series I/O modules.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                                 | Page |
|-------------------------------------------------------|------|
| 800 Series Discrete I/O Modules                       | 30   |
| 800 Series Discrete I/O Modules, System Interface     | 31   |
| 800 Series Discrete I/O Modules, I/O Map              | 32   |
| 800 Series Discrete I/O Modules, Grounding Guidelines | 33   |
| 800 Series I/O Modules, Installation                  | 34   |
| Quick Start Test—800 Series I/O Modules               | 38   |
| Key Pin Assignments for 800 Series I/O Modules        | 39   |
| Discrete I/O Module Specifications                    | 41   |

## 800 Series Discrete I/O Modules

### Features

Each 800 series discrete I/O module features:

- Status indicators
- Front accessible fuses
- A module handle that permits easy installation and removal
- A non-conductive module front that permits easy access of test probes

In addition, each module:

- Is designed for harsh, plant-floor environments
- Electrically isolates each point from logic
- Can be removed without disturbing rigid field wiring system
- Satisfies SWC requirements of IEEE and ANSI guides

### Electrical Isolation

Each I/O point is electrically isolated from the controller by an optical coupler. The I/O signals can withstand the severe voltage transients normally encountered in industrial environments without damage to the I/O module or controller. Moreover, the modules satisfy surge withstand capability (SWC) of both IEEE and ANSI guides.

All I/O points shut off in the event of a communication failure between a controller and the I/O module, and the module's Active LED indicator shuts off. Shut-off occurs within 300 ms of the signal loss.

### Ease of Installation

The I/O modules can be inserted into any I/O location in the 800 series I/O structure. The module slides easily into the module housing and does not interfere with any other module's operation.

### Shielded Design

The module's protective case shields the logic circuitry from any electrical interference and minimizes the possibility of any noise being coupled from the user side of the circuitry to adjacent modules. A ground is automatically established when the module is inserted into the housing. This low impedance earth ground originates from the housing's backplane.

## 800 Series Discrete I/O Modules, System Interface

### Interface Overview

When used with a PLC in a remote configuration, the appropriate RIO Adapter module or RIO Adapter module with ASCII, must be present in the I/O rack. (See instructions shipped with the adapter modules.)

### Indicators

The applicable indicators on the front of the module shows the status as listed below.

| Indicator    | Color | Meaning When ON or Blinking                                                                                                                                                                  |
|--------------|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Active       | Green | The module has passed its power diagnostics without error—it remains on until background diagnostics detect an error condition, loss of internal voltage, or loss of communication with PLC) |
| Discrete I/O | Red   | Power is available at the output of the module for use by field devices                                                                                                                      |
| Blown Fuse   | Red   | A fuse is blown                                                                                                                                                                              |
| Over Range   | Red   | One or more inputs have exceeded the valid input range                                                                                                                                       |
| Under Range  | Red   | One or more inputs have dropped below the valid input range                                                                                                                                  |
| Field Power  | Red   | Acceptable field power is being supplied.                                                                                                                                                    |

**NOTE:** The active indicator does not represent the condition of the I/O points. The indicator may be lit with one or more of the I/O points not working properly.

## 800 Series Discrete I/O Modules, I/O Map

### I/O Map Overview

The I/O map is used to direct the flow of data between the various I/O modules and the logic program. It is the tie between the references used in the logic program and the I/O module connection points.

### 800 Series Configuration

The 800 series I/O map lets you match the controller I/O addresses with what will be installed or with what actually exists in the field. The I/O map also tells the controller how to use an input signal in user logic, and, where to send an output signal. The format of register data (BCD - binary coded decimal or BIN binary) is specified on this screen. The screen objective is to load the card selections and reference number selections to complete the I/O configuration.

## 800 Series Discrete I/O Modules, Grounding Guidelines

### Grounding Guidelines

Adhere to the following guidelines for grounding the 800 series I/O modules:

- To have proper case ground, the housing must be connected to earth ground.
- When using shielded field circuit wires, do not ground the shield at both ends of the circuit (i.e., the module and the field device).
- Single point grounding should be used where possible.

Priority for shield grounding is as follows:

- Field side device case, if metal.
- Earth ground, as close to the field side device or module as possible.
- From shield to frame.

## 800 Series I/O Modules, Installation

### Installation Overview

Installation of the 800 series module involves unpacking the module, wiring the field connector, installing key pins in the housing, and mounting the module in its housing.

### Installing an 800 Series I/O Module

Use the following procedure to install an 800 series I/O module:

| Step | Action                                                                                                                                   |
|------|------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Remove module from its shipping box and check for damage. If damaged, contact salesman or distributor for correct replacement procedure. |
| 2    | Ensure power to housing is off.                                                                                                          |
| 3    | Designate housing slot for this module.                                                                                                  |
| 4    | Locate required connector assembly. (Part number AS-8534-000 or AS-8535-000). This assembly consists of one or two 20-pin connectors.    |

Remove the keying tabs on the connector prior to installing the module.

| Step | Action                                                                                                                                                                                                                                                                                                      |
|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 5    | <p>Remove old duct, if a different connector/cabling duct assembly is already present in designated housing slot.</p> <p>If there is a module to immediate left of slot designated for module's installation, temporarily remove it.</p>                                                                    |
| 6    | <p>As shown below, mount the new field connector/duct assembly to the left of the module's designated housing slot and secure it to the housing top and bottom using the two Phillips-head machine screws provided.</p>  |

When performing the following step, use the appropriate connector for the module to be installed, as provided in its specification table.

| Step | Action                                                       |
|------|--------------------------------------------------------------|
| 7    | Connect field-side wiring to proper pins on field connector. |

Terminals accept either two 141 AWG size wires or one 12 AWG size wire/point.

**NOTE:** Neat and proper workmanship methods by qualified personnel must be employed when making connections to this module. Take extra precautions when using stranded wire. Ensure that loose or projecting strands do not short circuit or ground the other terminals. The use of solid wire is recommended.

| Step | Action                                    |
|------|-------------------------------------------|
| 8    | Reinstall any module temporarily removed. |

When performing this step, refer to Appendix A for illustrations of optional key pin patterns for the 800 Series module to be installed. Appendix A contains key pin patterns for all 800 series I/O modules.

| Step | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9    | <p>When using key pins (provided with housing shipment), install them above and below housing slot selected for installation of module.</p> <p>The following illustration shows this optional mechanical keying system used to match the module type with a particular slot in the housing to ensure proper module replacement.</p> <div></div> <p>When facing housing place the knurled end of the key pins into the holes indicated by the P. Use a 1/2 in plastic head mallet or equivalent to drive the pin into the housing approximately 1/4 in.</p> <p><b>NOTE:</b> The keying system is optional.</p> <p>looking at front of housing under module slot</p> |
| 10   | Insert module into housing, firmly but carefully, seating edge connector in backplane.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

First-time installation of a module may be tight.

| Step | Action                                                                                                                      |
|------|-----------------------------------------------------------------------------------------------------------------------------|
| 11   | Insert module into housing, firmly but carefully, seating edge connector in backplane.                                      |
| 12   | Secure module to housing using captive slotted mounting screws at top and bottom of module front panel.                     |
| 13   | After confirming all modules are properly installed, apply proper field power and reapply power to programmable controller. |
| 14   | I/O map module.                                                                                                             |
| 15   | Start controller.                                                                                                           |
| 16   | Confirm that active light of module is illuminated.                                                                         |

## Quick Start Test—800 Series I/O Modules

### Running Quick Start Test

The following table provides the steps for running a quick start test:

| Step | Action                                                                                                                                                                                                                                                                                                                                                   |
|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Determine which channel and slot location are being used for this module.                                                                                                                                                                                                                                                                                |
| 2    | Wire a field device to the appropriate terminals (refer to the individual wiring diagrams/field connector drawings for that particular I/O module) on either the AS-8534-000 low density connector, or AS-8535-000 high density connector, (refer to the Specification section for your particular I/O module to determine which connector is required.) |
| 3    | Stop the controller.                                                                                                                                                                                                                                                                                                                                     |
| 4    | Install the I/O module.                                                                                                                                                                                                                                                                                                                                  |
| 5    | I/O Map the module, at the desired discrete or register reference.                                                                                                                                                                                                                                                                                       |
| 6    | Start the controller.                                                                                                                                                                                                                                                                                                                                    |
| 7    | Confirm that the modules active light is illuminated. (may require Step 8 wiring first).                                                                                                                                                                                                                                                                 |
| 8    | To turn an Input on apply the required power to the appropriate terminals (refer to the individual wiring diagrams/field connector drawings for your particular I/O module), and confirm that the red I/O light is illuminated after turning I/O point on.                                                                                               |

## Key Pin Assignments for 800 Series I/O Modules

### Charts

The key pin assignments chart is provided below:

|                                                                                     |  |  |  |  |  |
|-------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
|    | AS-B802-008                                                                       | AS-B803-008                                                                       | AS-B804-016                                                                       | AS-B805-016                                                                       | AS-B806-032                                                                         |
|    | AS-B808-016                                                                       | AS-B809-016                                                                       | AS-B820-008                                                                       | AS-B821-008<br>AS-B821-108                                                        | AS-B822-008*                                                                        |

## Part II

### 800 Series Analog I/O Modules

---

#### At a Glance

This part provides a detailed description of the 800 series analog I/O modules. It includes technical data and wiring information for each module.

#### What Is in This Part?

This part contains the following chapters:

| Chapter | Chapter Name                             | Page |
|---------|------------------------------------------|------|
| 3       | B846-001 and B846-002 Input Multiplexers | 45   |
| 4       | B872-100 Analog Output                   | 49   |
| 5       | B872-200 Analog Output                   | 67   |
| 6       | B873-002 and B875-002 Analog Input       | 87   |
| 7       | B873-012 and B875-012 Analog Input       | 103  |
| 8       | B875-102 High Speed Analog Input         | 119  |
| 9       | B875-111 and B877-111 Analog Input       | 151  |
| 10      | B875-200 Configurable A/D Input          | 179  |
| 11      | J890 and J892 RIO Interface Modules      | 213  |
| 12      | P890 and P892 RIO Processors             | 233  |

---

# Chapter 3

## B846-001 and B846-002 Input Multiplexers

---

**Purpose**

The purpose of this chapter is to describe the features and functionality of the B846-001 and B846-002 input multiplexers.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                   | Page |
|-----------------------------------------|------|
| B846-001 and B846-002 Field Connections | 46   |
| B846-001 and B846-002 Specifications    | 47   |
| B846-001 Parameter Configuration        | 48   |

## B846-001 and B846-002 Field Connections

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring. The connector is an AS-8535-000.

## B846-001 and B846-002 Specifications

### B846 Multiplexer Specifications

The following table shows the specifications for the B846 input multiplexers.

|                                                                                                                                                           |               |                                        |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|----------------------------------------|
| B846-001                                                                                                                                                  |               | Voltage Input Multiplexer              |
| B846-002                                                                                                                                                  |               | Current Input Multiplexer              |
| Number of Input Points                                                                                                                                    |               | 16, potential isolated from each other |
| Address Capacity                                                                                                                                          |               | 1 register data out (binary data type) |
| Ranges                                                                                                                                                    | B846-001      | 0-5 V, 1-5 V, +/- 10 V                 |
|                                                                                                                                                           | B846-002      | 4 to 20 mA                             |
| Input Impedance                                                                                                                                           | B846-001      | Equal to B873 or B875                  |
|                                                                                                                                                           | B846-002      | 250 $\Omega$                           |
| Relay Response Time                                                                                                                                       |               | 10 ms including diagnostics            |
| Power Required                                                                                                                                            | +5 VDC        | 65 mA                                  |
|                                                                                                                                                           | +4.3 VDC      | 1 mA                                   |
|                                                                                                                                                           | -5 VDC        | 0 mA                                   |
| Update Time                                                                                                                                               | B846 MUX only | 3 ms                                   |
|                                                                                                                                                           | with B875     | 20 ms                                  |
|                                                                                                                                                           | with B873     | 20 ms                                  |
| <b>Note:</b> An over range condition on any B873/B875 channel will add approximately 200 ms per over range channel, to update time of remaining channels. |               |                                        |
| Terminal Connector                                                                                                                                        |               | AS-8535-000                            |
| Reference Type                                                                                                                                            |               | Mapped as 1 register output 4x         |
| Output Type                                                                                                                                               |               | BIN/BCD                                |

## B846-001 Parameter Configuration

### Parameter and Default Values

Parameter configuration window

| Parameter Name           | Value         |
|--------------------------|---------------|
| MAPPING                  | WORD (%MW-4X) |
| OUTPUTS STARTING ADDRESS | 1             |
| OUTPUTS ENDING ADDRESS   | 1             |
| OUTPUT TYPE              | BINARY        |

Module configuration

| Parameter Name           | Default Value | Value Options Available |
|--------------------------|---------------|-------------------------|
| Mapping                  | WORD (%MW-4X) | -                       |
| Outputs Starting Address | 1             | -                       |
| Outputs Ending Address   | 1             | -                       |
| Output Type              | BINARY        | BCD                     |

Mapping parameter references

# Chapter 4

## B872-100 Analog Output

---

### Purpose

The purpose of this chapter is to describe the features and functionality of the B872-100 analog output module.

### What Is in This Chapter?

This chapter contains the following topics:

| Topic                                    | Page |
|------------------------------------------|------|
| B872-100 Analog Output                   | 50   |
| B872-100 Data Value to Output Conversion | 51   |
| B872-100 Field Connections               | 53   |
| B872-100 - Setting Module DIP-Switch     | 54   |
| B872-100 Quick Start Test                | 56   |
| Calibration                              | 58   |
| B872-100 Specifications                  | 64   |
| B872-100 Parameter Configuration         | 66   |

## B872-100 Analog Output

### Characteristics

The B872-100 4-channel analog output module converts numerical data ranging from 0000 to 4095 into current ranging from 4 to 20 mA with 12-bit resolution.

The module is designed to control the state of each output channel when the PLC is reset or stopped. The output of the channel can either remain at the last value (hold) or return to zero (RTZ).

You can select the hold or RTZ option for each of the 4 isolated outputs using a 4-position DIP switch. A switch is associated with each output (switch 1 for output 1, etc.).

- The RTZ function brings the outputs to 0.0 mA as a safety feature
- The hold function maintains the last valid output value after the loss of OURBUS communication

#### NOTE: Module Output Alert

RTZ disables the output of the module so that output current goes to 0.0 mA, not to zero scale (4 mA). Monitor voltage goes below 1V to indicate an output current loss of less than 4 mA.

The module has four isolated analog outputs, and is capable of updates to all four channels every 1 ms. The 12-bit resolution and the absolute accuracy of  $\pm 0.1\%$  at 25 °C provides precise control of your application.

The following figure shows the simplified schematic of the B872-100 module.

## B872-100 Data Value to Output Conversion

### Data Value to Output Conversion Chart

The B872 accepts data values ranging from 0000 to 4095 and converts them into output currents of 4 to 20 mA. The output current is directly proportional to the data value plus 4 mA. Refer to the figure below for a data value to output conversion chart.

### Determining Data value or Output Current

To determine either the data value or the output current, use the following calculations:

To solve for output current:

$$\text{Current} = (\text{Data Value} / 256) + 4$$

For example:

$$\text{Current} = (3162 / 256) + 4$$

$$\text{Current} = (12.35156) + 4$$

$$\text{Current} = 16.35156$$

$$\text{Current} = 16.352$$

To solve for data value:

$$\text{Data Value} = (\text{Current} - 4) \times 256$$

For example:

$$\text{Data Value} = (10.402 - 4) \times 256$$

$$\text{Data Value} = (6.402) \times 256$$

$$\text{Data Value} = 1638.912$$

$$\text{Data Value} = 1639$$

**NOTE:** Data values larger than 4095 will result in currents less than 20 mA. Refer to the in this chapter. The equations above are valid for data values of 0-4095 only. The module can output values in the range of 4096-8191 in a offset scale. If you use this offset range, be sure to subtract 4096 from the calculations provided above. *Trim-Pots Location and Voltmeter Connections*, [page 60](#)

## B872-100 Field Connections

### User Connections

User connections are made to a standard screw terminal strip, and the rigid wiring system permits module insertion or removal without disturbing the wiring.

### Terminal Numbering and Functions

Terminal numbering, and their corresponding output functions, are presented in the figure below.

## B872-100 - Setting Module DIP-Switch

### Switch location and position

The four position DIP-switch is located on the rear of the module. This switch controls the state of each channel when the system is reset or stopped. The output to the channel can either remain at the last value (Hold) or go to 0.0 mA Return-To-Zero (RTZ).

Set the switch for either hold or RTZ prior to installation of the module. Each of the four switches control the mode of operation for its associated output (i.e., switch 1 for output 1, etc.).

### Switch Settings

The following figure presents DIP switch settings for the B872-100 module. Also, refer to the label located on the left side of the module itself.

4- Position DIP- Switches

|                  |                                          |
|------------------|------------------------------------------|
| Switches         | Functions                                |
| 1,2,3,4- Channel | state of output when PLC resets or stops |
|                  | For RTZ:                                 |
|                  | SW=L                                     |
|                  | For hold:                                |
|                  | SW=R                                     |

Set the switch to the left to select return-to-zero or to the right to select hold (viewing the rear of the module when held vertically). Channels are set independently.

**NOTE:** The output state after power-up initialization is dependent on the position of DIP-switch. Open circuit in the following table results in current 0 mA.

The following table represents the Relationship Between Power-up and DIP-Switch Settings.

| Possible Event During Power-up | Switch=RTZ   | Switch=HOLD  |
|--------------------------------|--------------|--------------|
| At Power-up                    | Open Circuit | Open Circuit |
| After Receiving Valid Data     | Data         | Data         |
| PC Stop (After Run)            | Open Circuit | Last Data    |
| Loss of +5 V                   | Open Circuit | Open Circuit |
| Loss of +4.3 VIO               | Open Circuit | Last Data    |
| Loss of +5 V & +4.3 VIO        | Open Circuit | Open Circuit |

# B872-100 Quick Start Test

## Title of Overview Block

This test configures the module as follows: B872 (analog 4 channel output), and output state set to RTZ (return-to-zero).

## Required Parts

Before starting, make sure you have the following items:

- A loop power supply (24 Vdc, +/-10% at 1-2 A
- A resistance decade box, or two 510  $\Omega$  resistors at 1/4 watts 5%
- A AS-8535-000 high density connector

## Configuration Switch

The following table gives the procedure for setting the configuration switch:

| Step | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| 3    | Determine which channel and slot location are being used for this module.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Step | Action                                                                                                                                                                                                                                                                                                                   |
|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4    | <p>Stop the controller, and remove AC power.</p> <p>The following figure illustrates Current Output #2 (sourcing)</p> <div><p>current output # 2<br/>(sourcing)</p><p>current sink 11</p><p>current source 12</p><p>current source 13</p><p>monitor 14</p><p>510</p><p>510</p><p>Vs = 24 Vdc<br/>user supplied</p></div> |
| 5    | Insert the module into the rack.                                                                                                                                                                                                                                                                                         |
| 6    | Re-apply AC power, attach programmer, and access the I/O Map.                                                                                                                                                                                                                                                            |
| 7    | Map the module as a B872, registers 40001-40004 binary.                                                                                                                                                                                                                                                                  |
| 8    | Start the controller.                                                                                                                                                                                                                                                                                                    |
| 9    | <p>Confirm that the module's active light is illuminated.</p> <p><b>Note:</b> Active on steady = OK.</p>                                                                                                                                                                                                                 |
| 10   | Access the programming software. Enter a value of 2048 in any or all of the declared 4xxx registers in the I/O Map assigned to the module.                                                                                                                                                                               |
| 11   | Using the monitor terminals for each output, measure what should be 3 Vdc. This value is equivalent to 12 mA of current in the loop. Refer to the table below.                                                                                                                                                           |
| 12   | <p>Continue to provide your output registers with values from Table 2. This assures each output is capable of a span of 4-20 mA.</p> <p><b>Note:</b> When using the two resistors in lieu of a decade box, your voltage monitor readings may vary slightly, because of the value and tolerance of the component.</p>     |

Current and Monitor Voltage

The following table shows the relationship between current and monitor voltage.

| Register Value | Loop Current | Monitor Voltage |
|----------------|--------------|-----------------|
| 4xxx=0001      | 4 mA         | 1.0 V           |
| 4xxx=1024      | 8 mA         | 2.0 V           |
| 4xxx=2048      | 12 mA        | 3.0 V           |
| 4xxx=3071      | 16 mA        | 4.0 V           |
| 4xxx=4095      | 20 mA-1 LSB  | 5.0 V-1 LSB     |

# Calibration

## Calibration Intervals

The analog output module is calibrated at the factory prior to shipment. To ensure the module's accuracy you should calibrate the trim-pots for each output regularly. Calibration is recommended at 12 month intervals for operation between 25-45 °C and at 6 month intervals between 0-60 °C.

## Calibration Tools

The following tools are needed to calibrate an analog output module:

- 1) A programming panel
- 2) A precision voltmeter, with an accuracy of +/-0.0001 volts on a 10 volt scale
- 3) A 1/4 inch Phillips screwdriver
- 4) A 1/8 inch standard screwdriver

## Calibration Procedure (Method 1)

To make the adjustments, a load and loop supply must be connected to the channel being calibrated. There are two ways to make the adjustments. One procedure requires a load and loop supply to be assembled using voltage and resistance (Method 1). Refer to the calibration voltage/resistance procedure and the voltmeter connections diagram. The second procedure uses the existing field side circuit (Method 2). Refer to the calibration procedure, the voltmeter connections diagram, and the voltage/resistance chart. The following table the calibration voltage/resistance procedure (Method 1).

| Step | Action                                                                                                                                                                                                                                                                                                                      |
|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Use a close tolerance 250 W resistor (+/-0.01%) and a voltage supply of between 12 and 35 Vdc. The voltage readings will be taken across the resistor. Connect as indicated in the upper part of the voltmeter connections diagram.                                                                                         |
| 2    | Remove the two screws and the label located on the front panel of the analog output module. This allows you access to the trim-pots. There are two trim-pots per output. The first two trim-pots are for output number one, the second set is for output two, etc. Refer to the figure below for the location of trim pots. |
| 3    | Open the analog output module handle to expose the connectors and terminals.                                                                                                                                                                                                                                                |
| 4    | Load the data value of 0000 into the output register for the channel under test.                                                                                                                                                                                                                                            |
| 5    | Adjust the top (4 mA calibrate) trim-pot of the set for a voltage of +1.0000, +/-0.002 volts. This calibrates to +/-0.05% of full scale.                                                                                                                                                                                    |
| 6    | Manually program a data value of 4095 into the output register for channel one.                                                                                                                                                                                                                                             |

| Step | Action                                                                                                                                                                                                                                               |
|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7    | Adjust the bottom (20 mA calibrate) trim-pot of the set for a voltage reading of +4.9990, +/-0.002 volts. This calibrates to +/-0.05% of full scale.                                                                                                 |
| 8    | Return to step 4 and repeat steps 4-8 until module is within tolerance.                                                                                                                                                                              |
| 9    | Move connections to next channel to calibrate, and repeat steps 4 through 8 for each output channel.                                                                                                                                                 |
| 10   | After the calibration procedure is complete, disconnect the voltmeter, return connections to their original state, close module handle, and replace front label that covers the trim-pots. pot locking paint, and other substances are not required. |

Trim-Pots Location and Voltmeter Connections

The following figure shows the location of the Trim-Pots on the B872 Module.

The following figure is the voltmeter connections diagram for the B872-100 module.

**Calibration Procedure (Method 2)**

The following table gives the calibration procedure (Method 2) for the B872-100 module:

| Step | Action                                                                                                                                                                                                                 |
|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Connect loop supply and load resistor (if any) as indicated in the lower part of the voltmeter connections diagram. Verify that resistor and loop supply are within limits as defined by the voltage resistance chart. |
| 2    | Connect voltmeter to monitor terminals as indicated in the lower part of the Voltmeter connections diagram.                                                                                                            |
| 3    | Load the data value of 0000 into the output register for the channel under test.                                                                                                                                       |
| 4    | Adjust the top (4 mA calibrate) trim-pot of the set for a voltage of +1.0000, +/-0.002 volts. This calibrates to +/-0.05% of full scale.                                                                               |
| 5    | Manually program a data value of 4095 into the output register for channel one.                                                                                                                                        |
| 6    | Adjust the bottom (20 mA calibrate) trim-pot of the set for a voltage reading of +4.9990, +/-0.002 volts. This calibrates to +/-0.05% of full scale.                                                                   |
| 7    | Return to step 3 and repeat steps 3-6 until module is within tolerance.                                                                                                                                                |
| 8    | Move connections to next channel to calibrate, and repeat steps 3 through 7 for each output channel.                                                                                                                   |

| Step        | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |             |        |    |   |    |     |    |      |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|--------|----|---|----|-----|----|------|
| 9           | <p>After the calibration procedure is complete, disconnect the voltmeter, return connections to their original state, close module handle, and replace front label that covers the trim-pots. Pot locking paint, and other substances are not required.</p> <p>The following figure is the voltage/resistance chart.</p>  <table border="1"><caption>Data points for the allowable range boundary</caption><thead><tr><th>VLOOP (Vdc)</th><th>R (Ωs)</th></tr></thead><tbody><tr><td>10</td><td>0</td></tr><tr><td>30</td><td>500</td></tr><tr><td>60</td><td>2500</td></tr></tbody></table> | VLOOP (Vdc) | R (Ωs) | 10 | 0 | 30 | 500 | 60 | 2500 |

# Chapter 5

## B872-200 Analog Output

---

**Purpose**

The purpose of this chapter is to describe the features and functionality of the B872-200 analog output module.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                    | Page |

## B872-200 Overview

### Characteristics

The B872-200 4-channel analog (D/A) output module converts numerical data ranging from 0000 to 4095 into output voltage ranges (12-bit resolution).

The analog output module allows you to drive a wide array of field devices requiring different voltages based upon your unique application. You can select from four available output voltage ranges. The ranges, which are 0 to 5 V, 0 to 10 V, -5 to 5 V, and -10 to 10 V, are selected by means of four pairs of jumpers, one pair per channel. You can operate multiple ranges simultaneously.

The module is designed to allow you to control the state of each output channel when the programmable controller is reset or stopped. The output of the channel can either remain at the last value (HOLD) or go to 0.0 mV i.e., return-to-zero (RTZ). You can select this option for each of the four isolated outputs using a four-position DIP switch. A switch is associated with each output (switch 1 for output 1, etc.). The HOLD or RTZ function is selected by you to meet your specific application. The RTZ function allows you to bring the outputs to zero as a safety feature. The HOLD function allows you to maintain the last valid output value after the loss of Ourbus communication.

**NOTE:** Operative Interruption Hazard

RTZ disables the output of the module so that output voltage goes to zero, independent of range selected.

The module has four isolated analog outputs and is capable of updates to all four channels every 1 ms. The 12-bit resolution and the absolute accuracy of +0.1% at 25°C provides precise control of your application. Refer to the figure below for the simplified schematic of the module.

The following figure is the simplified schematic diagram, for the B872-200 Module.

## B872-200 Data Value to Output Conversion

### Data Value Ranges

The B872 accepts data values ranging from 0000 to 4095 and converts them into output voltages for all four ranges. The output voltage is directly proportional to the data value. The figure below is a data value to output conversion chart for the B872-200 module.

## Sample Calculations

Calculations for determining voltage reading or data value for 0 to 5 V or 0 to 10 V ranges:

To solve for voltage reading:

$$\text{voltage output} = \frac{\text{total voltage span} \times \text{data value}}{4096}$$

where the *total voltage span* is the sum from lowest to highest voltage in the selected range. If the range is -10 to +10 V, the *total voltage span* is 20 V.

For example:

$$\text{Voltage Output} = \frac{5 \times 1024}{4096}$$

$$\text{Voltage Output} = 1.250 \text{ VDC}$$

To solve for data value:

$$\text{Data Value} = \frac{\text{Output Volts} \times 4096}{\text{total voltage span}}$$

For example:

$$\text{Data Value} = \frac{3.1104 \times 4096}{5}$$

$$\text{Data Value} = 2548$$

Calculations for determining voltage reading or data value for -5 to 5 V or -10 to 10 V Ranges:

To solve for voltage output:

$$\text{Voltage Output} = \frac{\text{total voltage span} \times \text{Data Value} + \text{Offset Voltage}}{4096}$$

where *offset voltage* is the lower number in the selected range. If the range is -10 to +10 V, the *offset voltage* is -10 V.

For example:

$$\text{Voltage Output} = \frac{10 \times 1024 + (-5)}{4096}$$

$$\text{Voltage Output} = -2.500 \text{ VDC}$$

To solve for data value:

$$\text{Data Value} = \frac{(\text{Voltage Output} - \text{Offset Voltage}) \times 4096}{\text{total voltage span}}$$

For example:

$$\text{Data Value} = \frac{(1.2183 - (-5)) \times 4096}{10}$$

$$\text{Data Value} = 2547$$

Examples:

$$-5 \text{ to } 5 \text{ V} = 10 \text{ V}$$

Examples:

$$-5 \text{ to } 5 \text{ V} = -5 \text{ V}$$

## B872-200 Field Connections

### User Connections

User connections are made to a standard screw terminal strip and the rigid wiring system permits module insertion or removal without disturbing the wiring. Terminal numbering and their corresponding output functions are presented in the figure below.

## B872-200 - Setting Module Jumpers

### Location and Settings

The jumpers are located on the left side of the module (look for four access holes). The holes allow access to the four pairs of jumpers which are used to select an output voltage range for the associated channel.

Set the desired voltage range for 0 V to 5 V, 0 V to 10 V, -5 to 5 V, or -10 V to +10 V prior to installation. Refer to the figure below for the jumper settings. Also refer to the left side of the module itself. The module is shipped set for 0 to 10 V.

The following figure gives the jumper settings for the B872-200 module:

## B872-200 - Setting Module DIP-Switch

### 4-Position DIP-Switch

The four position DIP-switch is located on the rear of the module. This switch controls the state of each channel when the system is reset or stopped. The output to the channel can either remain at the last value (Hold) or go to 0.0 mA Return-To-Zero (RTZ).

Set the switch for either hold or RTZ prior to installation of the module. Each of the four switches control the mode of operation for its associated output (i.e., switch 1 for output 1, etc.). Refer to the figure below for switch settings. Also, refer to the label located on the left side of the module itself.

The following figure gives DIP-Switch Settings for the B872-200 module.

4- Position DIP- Switches

Set the switch to the left to select return-to-zero or to the right to select hold (viewing the rear of the module when held vertically). Channels are set independently.

**NOTE:** The output state after power-up initialization is dependent on the position of DIP-switch. Open circuit in the following table results in current 0 mA.

The following table shows the relationship between power-up & DIP-switch settings.

| Possible Event During Power-up                                                                                                                  | Switch=RTZ | Switch=HOLD |
|-------------------------------------------------------------------------------------------------------------------------------------------------|------------|-------------|
| At Power-up                                                                                                                                     | 0 Volts*   | 0 Volts*    |
| After Receiving Valid Data                                                                                                                      | Data       | Data        |
| PC Stop (After Run)                                                                                                                             | 0 Volts*   | Last Data   |
| Loss of +5 V                                                                                                                                    | 0 Volts*   | 0 Volts*    |
| Loss of +4.3 VIO                                                                                                                                | 0 Volts*   | Last Data   |
| Loss of +5 V & +4.3 VIO                                                                                                                         | 0 Volts*   | 0 Volts*    |
| *Active circuits of module are disconnected from the output terminals, the output terminals are connected to an internal 100 $\Omega$ resistor. |            |             |

## B872-200 Quick Start Test

### Title of Overview Block

This test configures the module as follows: B872 (analog 4 channel output), and output state set to RTZ (return-to-zero).

### Required Parts

Before beginning, make sure you have the following items:

- A digital voltmeter
- An AS-8535-000 high-density connector

### Running Quick Start Test

The following table gives the steps for running the quick start test:

| Step | Action                                                                                                                                                                                                                              |
|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | State of Output Control Switch<br>Place the 4-position DIP-switch (top rear) to the following positions:<br>SW1 = left<br>SW2 = left<br>SW3 = left<br>SW4 = left<br>Refer to <i>4-Position DIP-Switch</i> , <a href="#">page 75</a> |
| 2    | Output Voltage Range Jumpers<br>The B872 is shipped with each output set (jumpers located below the side access holes) for 0-10 V operation. Therefore, simply verify the jumper settings.                                          |
| 3    | Determine slot location for this module.<br><b>Note:</b> Remove keying tabs on the AS-8535-000 high density connector prior to installing module.                                                                                   |
| 4    | Stop the controller, and remove AC power.                                                                                                                                                                                           |
| 5    | Insert module into rack.                                                                                                                                                                                                            |
| 6    | Re-apply AC power, attach programmer, and access the I/O Map.                                                                                                                                                                       |
| 7    | Map the module as a B872, registers 40001-40004 binary.                                                                                                                                                                             |
| 8    | Start the controller.                                                                                                                                                                                                               |
| 9    | Confirm that the module's Active light is illuminated.                                                                                                                                                                              |
| 10   | Access the programming software. Enter a value of 2048 in any or all of the declared 4xxxx registers (40001-40004) in the I/O Map assigned to the module.                                                                           |
| 11   | Place your voltmeter leads on pins 5 and 6 of the field wiring connector to read the corresponding output voltage of 5.000 V. Refer to the table below.                                                                             |
| 12   | Continue to load values from Table 2 into the other registers to assure each output is capable of a span of 0-10 V.                                                                                                                 |

**Value and Monitor Voltage**

The following table shows the relationship between value and monitor voltage.

| Register Value | Monitor Voltage |
|----------------|-----------------|
| 4xxx=0001      | 0000 V          |
| 4xxx=1024      | 2.500 V         |
| 4xxx=2048      | 5.000 V         |
| 4xxx=3071      | 7.500 V         |
| 4xxx=4095      | 9.999 V         |

## B872-200 Calibration

### Principle

The analog output module is calibrated at the factory prior to shipment. To ensure the module's accuracy, you should calibrate the trim-pots for each output regularly. Calibration is recommended at 12 month intervals for operation between 25-45 °C, and at 6 month intervals between 0-60 °C.

### Required Tools

The following tools are needed to calibrate an analog output module:

- 1) A programming panel
- 2) A precision voltmeter, with an accuracy of +/-0.0001 volts on a 10 volt scale
- 3) A 1/4 inch Phillips screwdriver
- 4) A 1/8 inch standard screwdriver

### Calibration Procedure

The following table shows the steps to calibrate the B872-200 module:

| Step | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Remove the two screws and the label located on the front panel of the analog output module. This allows you access to the trim-pots. There is one trim-pot per output. The first trim-pot is for output number one, the second set is for output two, etc. The trim-pots adjust the range's total magnitude (full scale). Refer to the figure below.<br><b>Note</b> The 0.1% tolerance is the maximum FSR accuracy achievable thru calibration for any volt range. Calibrating any range to the 0.1% tolerance throws the other slightly off; i.e., tolerances for the remaining ranges available to that channel cannot be assumed better than +/- 0.25% FSR. |
| 2    | Open the analog output module handle to expose the connectors and terminals.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 3    | Connect the voltmeter minus lead (-) to the channel 1 (Analog Common CH1) and the plus lead (+) to the channel 1 (Analog Output CH1) terminal. Refer to the voltmeter connections diagram below.<br><b>Note</b> Field wiring may remain connected during calibration.                                                                                                                                                                                                                                                                                                                                                                                          |
| 4    | With the desired voltage range already selected. Manually program a data value of 4095 into the output register for channel two. Compare channel output voltage with anticipated voltmeter reading given in the table below.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 5    | Adjust the (full scale calibrate) trim-pot for corresponding channel to get desired voltmeter reading.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 6    | Repeat steps 3 through 5 for remaining channels.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 7    | After the calibration procedure is complete, disconnect the voltmeter, return all connections to their original state, close the module handle, and replace the front label that covers the trim-pots.<br>END OF PROCEDURE                                                                                                                                                                                                                                                                                                                                                                                                                                     |

Location of Trim-Pots

The following figure shows the location of the Trim-Pots on the B872-200 Module.

Voltmeter Connections

The following figure is the voltmeter connections diagram for the B872-200 module.

**Data Value to Output Channel**

The following table gives data value to output channel, for the B872-200 module.

| Selected Voltage Range | Data Value | Voltmeter Reading |
|------------------------|------------|-------------------|
| -5 to 5 V              | 4095       | 4.9976            |
| -10 to 10 V            | 4095       | 9.99951           |
| 0 to 5 V               | 4095       | 4.9988            |
| 0 to 10 V              | 4095       | 9.9976            |

## B872-200 Specifications

### B872-200 Specifications

The following table gives the specifications for the B872-200 module:

| Description                                                                                                                                    | Analog output, D/A                                                                                                                                                                                       |

# Chapter 6

## B873-002 and B875-002 Analog Input

---

**Purpose**

The purpose of this chapter is to describe the B873-002 and B875-002 analog input modules.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                                | Page |
|------------------------------------------------------|------|
| B873-002 and B875-002                                | 88   |
| B873-002 and B875-002 Switch Settings and Indicators | 89   |
| B873-002 and B875-002 Installation                   | 90   |
| B873-002 and B875-002 Calibration                    | 93   |
| B873-002 and B875-002 Throughput Rate                | 96   |
| B873-002 and B875-002 Field Connections              | 97   |
| B873-002 and B875-002 Specifications                 | 99   |
| B873-002 Parameter Configuration                     | 101  |
| B875-002 Parameter Configuration                     | 102  |

## B873-002 and B875-002

### B873-002 and B875-002 Modules

The B873-002 and B875-002 are analog input modules that can be used with 984 programmable controllers. The only difference between the two modules is that the B873-002 has four input channels and the B875-002 has eight input channels.

The module can be set to produce a data value in the standard range (0000 to 4096) or the elevated range (4095 to 8192). It accepts inputs of 1.0 to 5.0 V or 4 to 20 mA. (Refer to *B873-002 and B875-002 Field Connections*, [page 97](#)).

### Converting Analog Data

The input is converted to a numerical value, ranging from 0001 to 4095 or 4096 to 8191. Values of 0000, 4095, 4096, or 8192 indicate invalid data and a possible problem. (Refer to the *Data Value Reference Chart*, [page 95](#)). The value is directly proportional to the input signal. For example, an input voltage of 3.0 V causes the module to send a value of 2048 (standard). Or the input could be 12 mA, which would produce a value of 6144 (elevated). (Refer to *Input to Data Value Conversion*, [page 94](#)).

**NOTE:** No voltage or current on an input channel produces a data value of 0000 (standard) or 4095 (elevated).

The PLC polls the module and places the values into designated (3x) input registers.

Each time the module is powered up, it:

- 1 performs diagnostic tests
- 2 resets the input latches
- 3 presents a value of 0000 to the controller for each channel; this value is present for approximately 3 s after power up
- 4 starts converting the inputs according to the schedule found in the *B873-002 and B875-002 Throughput Rate*, [page 96](#)

## B873-002 and B875-002 Switch Settings and Indicators

### Switch Settings

There is a DIP switch located at the rear of the module. Switches 1 and 2 are not used. Switch 3 can be set to either module reset or module run. It must set to the module run position for the module to operate. Switch 4 is used to set which data value range the module will produce. Select either normal range or elevated range. Make sure you set Switch 3 and 4 before inserting the module into the housing. Refer to the figure below for a key to setting the DIP switch.

black box indicates switch in down position

### Indicators

The Active, Over Range, Under Range indicators are located on the front panel of the module. The Over Range and Under Range indicators are shared by all of the module's input channels. The module's status can be determined by referring to the table below.

The following table gives the Indicator readings for the B873-002 and B875-002 modules:

| Indicator   | State                      | Condition                                                                                                                                                                                                                    |
|-------------|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Active      | on<br>blinking<br>off      | The module is communicating properly and PLC is running<br>The module failed the powerup reference test<br>The module failed the internal diagnostic test/PLC is not in Run mode/communication from PLC to module has failed |
| Over Range  | off<br>on or<br>flickering | All input are within the valid input range<br>One or more inputs have exceeded the valid input range                                                                                                                         |
| Under Range | off<br>on or<br>flickering | All input are within the valid input range<br>One or more inputs have dropped below the valid input range                                                                                                                    |

## B873-002 and B875-002 Installation

### Installing the Module

Remove the module from the box and check for damage. If damage is found, contact your salesman or distributor for correct return procedure.

Set switch three to the module run position, and switch four to the data range selected for input - either standard or elevated - before inserting the module into the housing. (Refer to *Switch Settings*, page 89).

### Module Characteristics

The following figure shows the 873 / 875 module, at pre-installation.

Included with the module is an analog connector set (Part# AS-8533-001 for B873-002 and Part# AS-8533-002 for B875-002).

The connector set consists of two mounting screws, a wire duct, and either one (B873-002) or two (B875-002) field wiring connectors. Each connector has eighteen recessed slotted screw terminals and can accept various wire gauges, but 16 to 20 gauge is recommended for the field side wiring.

**NOTE:** The wiring connections can only be made with an 1/8 inch blade screwdriver.

The connector plugs into the module with the field wiring to the left. The removable connector permits module removal and replacement without disturbing the wiring. Refer to the diagram for the terminal numbering for the terminal functions.

The wire duct protects the connections to the analog input module from being damaged or loosened when the module to its immediate left is removed.

### Installing the Wire Duct

The following is the wire duct installation diagram, for the B873/B875 module.

## Steps to Installation

The following table lists the steps for installing the B873/B875 module:

| Step | Action                                                                                                                                                                                                                                                                                                     |
|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Turn off the power to the housing.                                                                                                                                                                                                                                                                         |
| 2    | Determine which slot will be used for the analog module.* If there is a duct present, and it is different from the one provided in the connector set, then it must be removed. This is accomplished by removing the two screws located on the top and bottom of the housing and then pulling the duct out. |
| 3    | If there is a module to the left of this slot, it must be removed until installation of the duct is complete.                                                                                                                                                                                              |
| 4    | Insert the wire duct between the two slots with the screw holes to the left. (Refer to the installation diagram.)                                                                                                                                                                                          |
| 5    | Using the two 1/4 inch slotted screws provided in the package, secure the wire duct to the housing.                                                                                                                                                                                                        |
| 6    | Re-install the module(s) and complete the wiring connections.<br>*The wire duct can not be installed for the left-most slot of the housing. Therefore the use of this slot for the analog module is not recommended.                                                                                       |

## B873-002 and B875-002 Calibration

### Required Tools

Calibration is recommended at 12 month intervals for operation at or below 405 C (1045 F) and at 6 month intervals between 405 and 605 C (1045 and 1405 F).

The following tools are needed to calibrate a B873-002 or B875-002 module in a running system:

|    |                                                                       |
|----|-----------------------------------------------------------------------|
| 1. | A programmer                                                          |
| 2. | A precision voltmeter                                                 |
| 3. | An Analog DC Voltage/Current                                          |
| 4. | A 1/4 inch Phillips screwdriver                                       |
| 5. | A 1/8 inch standard screwdriver                                       |
| 6. | An adhesive for the trim pot adjusting screw (e.g. Locktight Glyptol) |

### Calibration Adjustments

To achieve full accuracy of the module, allow it to warm up for one hour with a valid input present at the channel to be used for the calibration. Without warm up, the accuracy of the data values will be +/-%2 counts.

### Steps to Calibration

The adjustments can be made using a voltage or current source. Use steps 5a through 10a for voltage or steps 5b through 10b for current.

|                                |                                                                                                                                                 |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.                             | Remove trim pot access cover, located on the front panel.                                                                                       |
| 2.                             | Open module handle to expose connector(s) and terminal(s).                                                                                      |
| 3.                             | Unplug field wiring connector(s).                                                                                                               |
| 4.                             | Set up Programmer to monitor the register for the channel used for calibration.                                                                 |
| Method using a voltage source: |                                                                                                                                                 |
| 5a.                            | Connect the positive lead of the voltage source to the channel's input + terminal and the negative lead to the channel's input - terminal.      |
| 6a.                            | Set voltage source to output 1.00048 volts.                                                                                                     |
| 7a.                            | While monitoring the register, adjust the top trim pot until the value toggles between 0000 and 0001 (Standard) or 4095 and 4096 (Elevated).    |
| 8a.                            | Use an adhesive to secure the adjusting screw on the trimmer.                                                                                   |
| 9a.                            | Set voltage source to output 4.99951 volts.                                                                                                     |
| 10a.                           | While monitoring the register, adjust the bottom trim pot until the value toggles between 4095 and 4096 (Standard) or 8191 and 8192 (Elevated). |

| Method using a current source:*                                                                                                               |                                                                                                                                                 |
|-----------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| 5b.                                                                                                                                           | Connect the positive lead of the current source to the channel's input + terminal and the negative lead to the channel's input - terminal.      |
| 6b.                                                                                                                                           | Set current source to output 4.002 mA.                                                                                                          |
| 7b.                                                                                                                                           | While monitoring the register, adjust the top trim pot until the value toggles between 0000 and 0001 (Standard) or 4095 and 4096 (Elevated).    |
| 8b.                                                                                                                                           | Use an adhesive to secure the adjusting screw on the trimmer.                                                                                   |
| 9b.                                                                                                                                           | Set current source to output 19.998mA.                                                                                                          |
| 10b.                                                                                                                                          | While monitoring the register, adjust the bottom trim pot until the value toggles between 4095 and 4096 (Standard) or 8191 and 8192 (Elevated). |
| 11.                                                                                                                                           | Disconnect input source.                                                                                                                        |
| 12.                                                                                                                                           | Re-connect field wiring.                                                                                                                        |
| 13.                                                                                                                                           | Close module handle.                                                                                                                            |
| 14.                                                                                                                                           | Replace trim pot access cover.                                                                                                                  |
| * To use this method, a jumper must be connected between the Current Sense terminal and the Input + terminal of the channel to be calibrated. |                                                                                                                                                 |

### Input to Data Value Conversion

The following figure shows the Input to Data Value Conversion chart.

Calculation for determining Data Value (refer to the figure above and the table below):

Voltage:

(Input Voltage - 1) X 1024

Example: (Refer to Graph)

(4.4521V - 1) X 1024

3.4521 X 1024 = 3534.9504 (Add 4096 for Elevated Value)

Data Value = 3535 Standard 7631 Elevated

(Rounded to the nearest whole number)

Current:

(Input Current - 4) X 256

Example: (Refer to Graph)

(13.078mA - 4) X 256

9.078 X 256 = 2323.968 (Add 4096 for Elevated Value)

Data Value = 2324 Standard 6420 Elevated

(Rounded to the nearest whole number)

### Data Value Reference Chart

The following is the Data Reference Chart for the B873-200 & B875-200 Modules.

| Standard | Elevated | Input Voltage, Current, or Condition                                |
|----------|----------|---------------------------------------------------------------------|
| 0000     | 0000     | 1. First three seconds after power up<br>2. During failure recovery |
| 0000     | 4095     | Under range                                                         |
| 0000     | OFF      | 1.0000V or 4 mA                                                     |
| 4095     | 4096     | 4.999V or 19.995 mA                                                 |
| 4095     | 8192     | Over range                                                          |

## B873-002 and B875-002 Throughput Rate

### Update Interval

Update Interval:\*

B873- 4 Channels 400 ms

B875- 8 Channels 710 ms

Out of Range 220 ms per channel

All registers are updated every 400 or 710 ms, as long as the inputs on all of the channels are within the valid range. 220 ms is added to the update interval for each channel either under or over range. The input is considered under range when the voltage is at -3 V or below. This keeps unused channels from adding time to the update interval.

**NOTE:** The over range indicator will be on or flickering, if the input on any channel is between .999 and -2.999 V or below 4 mA; but the 220 ms time will not be added to the update interval.

### Update Interval Example

On an eight channel module, 2 channels are under range. All the registers assigned to the module will be updated every 1150 ms, until the inputs on the out of range channels return to the valid range. When they do, the update interval will return to 710 ms.

Update Interval =

$(400 \text{ or } 710) + (\text{out of range channels} \times 220)$

Using the example above:

$(710) + (2 \times 220) = 1150 \text{ ms}$

If one channel returned to the valid range, the update interval would reduce to 930 ms.

**NOTE:** As long as the channel is out of range, the register assigned to it will either have data of 0000 (4095 elevated), under range, or 4096 (8192 elevated), over range. (Refer to the data value reference chart)

\* The update interval is the amount of time necessary to update the data for all the registers assigned to the module.

## B873-002 and B875-002 Field Connections

### User Connections

User connections are made to a standard screw terminal strip; and the rigid wiring system permits module insertion or removal without disturbing the wiring.

### B873-002 Terminal Numbering and Wire Connections

B873-002 terminal numbering and corresponding input functions are presented below.

## B875-002 Terminal Numbering and Wire Connections

B875-002 terminal numbering and corresponding output functions are presented below.

**NOTE:** If a user has a process where the over-range or under-range detection is immaterial, the unused voltage or current terminal, including the shields, on the field connector should be jumpered to case ground.

If over-range or under-range detection is important to your process, and this detection is causing throughput problems with the unused channels (because they float or spike outside the range), then the unused voltage or current channels at the field connector, should be connected in parallel, to a valid Input channel. As long as the valid channel stays within range, the tied channels will also stay within range.

For current, 4 to 20 ma operation, the valid Input is the only Input requiring the 250  $\Omega$  resistor to be in the circuit.

Case ground is effective when the H8XX housing is connected to earth ground.

The shield cannot be connected, both ends, to the device and the module. The exception to this is where the device shield is part of the device input circuit, and is not connected internally to device case ground.

**NOTE:** Any module run-time diagnostic failure will result in a 0000 value being returned to the controller, regardless of selected range.

## B873-002 and B875-002 Specifications

### Module Specifications

The following table gives specifications for the B873-002 and B875-002 input modules.

|                                                                           |                                                                                                                                                                                |

# Chapter 7

## B873-012 and B875-012 Analog Input

---

**Purpose**

This chapter explains features and operation of the B873-012 and B875-012 analog input modules.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                                | Page |
|------------------------------------------------------|------|
| B873-012 and B875-012 Overview                       | 104  |
| B873-012 and B875-012 Switch Settings and Indicators | 105  |
| B873-012 and B875-012 Installation                   | 106  |
| B873-012 and B875-012 Calibration                    | 109  |

## B873-012 and B875-012 Overview

### Module Features

The B873-012 and B875-012 are analog input modules and can be used with 984 Programmable Controllers. The only difference between the two modules is that the B873-012 has four input channels and the B875-012 has eight input channels.

Both modules accept inputs of -10 to +10 volt analog signals. The input is converted to a numerical value, ranging from 0001 to 8191. Values of 0000 or 8192 indicate invalid data. (Refer to the Data Value Reference Chart.) The value is directly proportional to the input signal. For example, an input voltage of -5V causes the module to send a value of 2048. If the input signal goes to 5 V, the module sends a value of 6144. (Refer to Input to Output Data Conversion Chart.)

**NOTE:** 0.0 V or no voltage on an input channel produces a value of 4096.

The PLC polls the module and places the values into input registers (30XXX) designated by the programmer.

Each time the module is powered up, it performs diagnostic tests, resets the input latches, and, for each channel, presents a value of 0000 to the controller. The value is present for approximately three seconds after power up. The module will then start converting the inputs according to the schedule found in the Throughput Rate Section.

## B873-012 and B875-012 Switch Settings and Indicators

### Switch Settings

There is a DIP switch located at the rear of the module. Switches 1, 2 and 4 are not used. Switch 3 can be set to either module reset or module run. It must be set to the module run position for the module to operate. Make sure you set switch 3 before inserting the module into the housing. Refer to the figure below for DIP switch settings.

black box indicates switch in down position

### Indicators

The Active and Over Range indicators are located on the front panel of the module. The Over Range indicator is shared by all of the module's input channels. The module's status can be determined by referring to the table below.

| Indicator  | State          | Condition                                                                                                         |
|------------|----------------|-------------------------------------------------------------------------------------------------------------------|
| Active     | on             | The module is communicating properly and the PLC is running                                                       |
|            | blinking       | The module failed the powerup reference test                                                                      |
|            | off            | The module failed the internal diagnostic test/PLC is not in run mode/communication from PLC to module has failed |
| Over Range | off            | All input are within valid input range                                                                            |
|            | on or blinking | One or more inputs have exceeded the valid input range                                                            |

## B873-012 and B875-012 Installation

### Installing the Module

Remove the module from the box and check for damage. If damage is found, contact your salesman or distributor for correct return procedure.

Set switch three to the module run position and switch four to the data range selected for input - either standard or elevated - before inserting the module into the housing. (Refer to *Switch Settings*, page 105.)

### Module Characteristics

The following figure shows the B873-012 / B875-012 module at pre-installation.

Included with the module is an analog connector set (Part# AS-8533-001 for B873-012 and Part# AS-8533-002 for B875-012).

The connector set consists of two mounting screws, a wire duct, and either one (B873-012) or two (B875-012) field wiring connectors. Each connector has eighteen recessed slotted screw terminals and can accept various wire gauges, but 16 to 20 gauge is recommended for the field side wiring.

**NOTE:** The wiring connections can only be made with a 1/8 inch blade screwdriver.

The connector plugs into the module with the field wiring to the left. The removable connector permits module removal and replacement without disturbing the wiring. Refer to diagram for terminal numbering, for terminal functions.

The wire duct protects the connections to the analog input Module from being damaged or loosened when the module to it's immediate left is removed.

### Installing the Wire Duct

The following figure is the wire duct installation diagram.

### Steps to Installing the Wire Duct

The following step table describes the installation of the wire duct, for the B873-012 and B875-012 modules:

| Step | Action                                                                                                                                                                                                                                                                                                    |
|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Turn off the power to the housing.                                                                                                                                                                                                                                                                        |
| 2    | Determine which slot will be used for the Analog Module.* If there is a duct present and it is different from the one provided in the connector set, then it must be removed. This is accomplished by removing the two screws located on the top and bottom of the housing and then pulling the duct out. |
| 3    | If there is a module to the left of this slot, it must be removed until installation of the duct is complete.                                                                                                                                                                                             |
| 4    | Insert the wire duct between the two slots with the screw holes to the left. (Refer to the installation diagram.)                                                                                                                                                                                         |
| 5    | Using the two 1/4 inch slotted screws provided in the package, secure the wire duct to the housing.                                                                                                                                                                                                       |
| 6    | Re-install the module(s) and complete the wiring connections.<br>* The duct cannot be installed for the left-most slot of the housing. Therefore the use of this slot for the analog module is not recommended.                                                                                           |

## B873-012 and B875-012 Calibration

### Required Tools

Calibration is recommended at 12 month intervals for operation at or below 405 C (1045 F), and at 6 month intervals between 405 and 605 C (1045 and 1405 F).

The following table indicates the tools required, to calibrate the B873-012 and B875-012 modules:

|    |                                                                       |
|----|-----------------------------------------------------------------------|
| 1. | A programmer                                                          |
| 2. | A precision voltmeter                                                 |
| 3. | An Analog DC Voltage/Current                                          |
| 4. | A 1/4 inch Phillips screwdriver                                       |
| 5. | A 1/8 inch standard screwdriver                                       |
| 6. | An adhesive for the trim pot adjusting screw (e.g. Locktight Glyptol) |

### Gain Adjustments Procedure

To achieve full accuracy of the module, allow it to warm up for one hour, with a valid input present at the channel to be used for the calibration. Without warm up, the accuracy of the data values will be +2 counts. The following table gives the steps for adjusting the gain on the B873-012 and B875-012 modules:

| Step | Action                                                                                                                                     |
|------|--------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Remove trim pot access cover, located on the front panel.                                                                                  |
| 2    | Open module handle to expose connector(s) and terminal(s).                                                                                 |
| 3    | Unplug field wiring connector(s).                                                                                                          |
| 4    | Set up Programmer to monitor the register for the channel used for calibration.                                                            |
| 5    | Connect the positive lead of the voltage source to the channel's input + terminal and the negative lead to the channel's input - terminal. |
| 6    | Set voltage source to output 9.99877 volts.                                                                                                |
| 7    | While monitoring the register, adjust the trimmer until the value toggles between 8191 and 8192 in binary mode.                            |
| 8    | Use an adhesive to secure the adjusting screw on the trimmer.                                                                              |
| 9    | Disconnect input source.                                                                                                                   |
| 10   | Re-connect field wiring.                                                                                                                   |
| 11   | Close module handle.                                                                                                                       |
| 12   | Replace trim pot access cover.                                                                                                             |

### Input Voltage to Output Data Conversion

The following is the input voltage to output data conversion chart.

### Determining Data Value from Input Voltage

Calculation for determining data value from input voltage (refer to the figure above and the table below).

$$(\text{input voltage} + 10) \times 409.6$$

Example: (refer to graph)

$$(6.88824 \text{ V} + 10) \times 409.6$$

$$16.88824 \times 409.6 = 6917.4231$$

data value = 6917 (Rounded to the nearest whole number)

### Data Value Reference Chart

The following is the data value reference chart for the B873-012 & B875-012 input modules.

| Data Value | Input Voltage, Current, or Condition                                                 |
|------------|--------------------------------------------------------------------------------------|
| 0000       | 1. First three seconds after powerup<br>2. During failure recovery<br>3. Under range |
| 0001       | -9.99756 V                                                                           |
| 4096       | 1. 0.00000 V<br>2. No voltage at input terminal                                      |
| 8191       | 9.99756 V                                                                            |
| 8192       | Over range                                                                           |

## B873-012 and B875-012 Throughput Rate

### Update Interval

The following table provides Update Intervals for the B873-012 and B875-012 Modules.

| Update Interval:* |            |                    |
|-------------------|------------|--------------------|
| B873-             | 4 Channels | 400 ms             |
| B875-             | 8 Channels | 710 ms             |
| Out of Range      |            | 220 ms per channel |

All registers are updated every 400 or 710 ms, as long as the inputs on all of the channels are within the valid range. 220 ms is added to the update interval for each channel either under or over range.

### Throughput Rate Example

On an eight channel module, 2 channels are under range. All the registers assigned to the module will be updated every 1150 ms, until the inputs on the out of range channels return to the valid range. When they do, the update interval will return to 710 ms.

Update Interval =

$$(400 \text{ or } 710) + (\text{Out of Range Channels} \times 220)$$

Using the example above:

$$(710) + (2 \times 220) = 1150 \text{ ms}$$

If one channel returned to the valid range, the update interval would reduce to 930 ms.

**NOTE:** As long as the channel is out of range, the register assigned to it will either have data of 0000 (4095 Elevated), under range, or 4096 (8192 Elevated), over range. (Refer to *Data Value Reference Chart*, [page 111](#))

\* The Update Interval is the amount of time necessary to update the data for all the registers assigned to the module.

**NOTE:** Any module run-time diagnostic failure will result in a 0000 value being returned to the controller, regardless of selected range.

## B873-012 and B875-012 Field Connections

### User Connections

User connections are made to a standard screw terminal strip, and the rigid wiring system permits module insertion or removal without disturbing the wiring.

### B873-012 Terminal Numbering and Wire Connections

B873-012 terminal numbering and corresponding input functions are presented in the figure below.

B875-012 terminal numbering and corresponding input functions are presented in the figure below.

## B873-012 and B875-012 Specifications

### Module Specifications

The following table gives specifications for the B873-012 and B875-012 input modules.

|                                                                           |                                                                                                                                                   |
|---------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| Description                                                               | Analog input<br>-10 to +10 VDC                                                                                                                    |
| Number of Channels                                                        | 4, (B873-012)<br>8, (B875-012)                                                                                                                    |
| Operating Range                                                           | -10 to +10 VDC                                                                                                                                    |
| Impedance                                                                 | 0.5 M $\Omega$ per input<br>1 M $\Omega$ differentially                                                                                           |
| Resolution                                                                | 13 bit                                                                                                                                            |

# Chapter 8

## B875–102 High Speed Analog Input

---

### Purpose

This chapter describes the functional and physical characteristics of the B875–102 high speed analog input module.

### What Is in This Chapter?

This chapter contains the following topics:

| Topic                                                                    | Page |

## B875–102 High Speed Analog Input, Inputs

### Configuration

Module inputs are configurable in two groups by means of DIP switches.

The following table shows input switch group assignments for the four or eight input circuit configurations.

| Configuration        | Input Group A | Input Group B |
|----------------------|---------------|---------------|
| Eight Input circuits | 1, 2, 3, 4    | 5, 6, 7, 8    |
| Four input circuits  | 1, 2          | 3, 4          |

### Input Ranges

The following table shows the five input ranges acceptable to each input range group. The module will accept an input as much as 2% FSR above its specified range without going into an over-range condition, but nothing below range.

| Voltage range (V) | Corresponding Current Range (mA) |
|-------------------|----------------------------------|
| 0—5               | 0—20                             |
| 0—10              | 0—40                             |
| 1—5               | 4—20                             |
| -10—+10           | -40—+40                          |
| -5—+5             | -20—+20                          |

For purposes of determining load and protection considerations for the inputting of field circuits, The following figure is a schematic diagram of the input circuit's front end. Note the built-in 250  $\Omega$  resistor connected to the current input terminal. When the current sense terminal is externally jumpered to the positive input terminal, current input becomes possible for that input regardless of the voltage range selected.

**NOTE:** The current sense function has been provided specifically for the 4—20 mA current loop applications (1—5 V input range). However, current mode is operable on all ranges.

## B875-102 High Speed Analog Input, Input Circuit Front End.

**Notes:**

1. Shield is tied to the ground within the module on the field side of the opto-barrier.
2. Circuit shown with current sense input jumpered to +input terminal for current inputs (instead of voltage inputs).

## B875–102 High Speed Analog Input, Performance Considerations

### Data Update Period

The data update period is the time taken by the module to present fresh data for each channel. With four input circuits, this period is no more than 2.4 ms; for an eight input circuit configuration, this period is no more than 3.0 ms.

### Autocalibration

An internal autocalibration process is executed at appropriate times (if necessary) to compensate signal processing for front end drift. The autocalibration function employs feedback mechanisms to adjust the reference voltage to offset gain in the analog to digital converter. Calibration is monitored continuously in the background and adjusted if and when necessary. The following figure shows autocalibration points for all five input ranges. Autocalibration points are indicated by heavy dots on slope line.

The autocalibration process uses the 10 V reference to calibrate the module. The reference voltage is factory preset to exactly 10 volts (zeroed to four places). It should be readjusted in the field once per year.

### Input Data Conversion

The input module performs an analog-to-digital conversion of an input analog signal with 12 bit resolution (i.e., 1 part in 4096). This implies that the least significant bit of the output code corresponds to slightly more than 0.024% of full scale.

The following illustration is a coarse grain conversion chart for plotting analog input against the equivalent numerical value output to the PC in raw binary format. The example illustrated shows an input voltage of 1.25 V (25% of 5 V FSR) and a numerical count of 1024 (25% of 4200) as projected through the 455 slope line.

Calculate exact values using the following proportional equation:

Where FSR is full scale range for analog input (including bipolar) and FCR is full count range (4200) in a raw binary format.

## B875-102 High Speed Analog Input Autocalibration Points—All Ranges

part A  
1-5 volt range  
0.9766 mV/LSB

part B  
0-10 volt range  
2.441 mV/LSB

part C  
0-5 volt range  
1.22 mV/LSB

part E  
-5 to +5 volt range  
2.441 mV/LSB

B875-102 Input Signal vs. Output Data (Raw Binary Format)

## Format Conversion

The module is capable of presenting the digitized data to the PC in either raw binary (RB) or converted binary (CB) format. The bit pattern in each case is different. The format is switch selectable and need not be the same for each group of input circuits. A Modicon programmer will display either type of data in one of three different ways: binary, hexadecimal, or decimal form.

## Conversion Accuracy

Conversion linearity for this module is 0.05% of full scale—referenced to a straight line drawn through the measured full-scale value and the measured zero point—over the module's operating temperature range.

**Raw Binary (RB) Format** After digitizing the input signal, the input module presents data in RB format. In decimal representation, data in RB format must be within the 0 to 4200 range. Normally, a 12--bit device would have an upper data limit of 4095. This analog module has the means of allowing the input to be up to 2% over-range at the same resolution (i.e., the count in raw binary may go up to 4200). In RB format, the data range is the same regardless of the voltage range.

**Converted Binary (CB) Format** CB is obtained by transforming the RB format within the module. When CB data is viewed by the PC or programmer in decimal mode, it looks like a 4-digit voltmeter (DVM) with no sign or decimal point. In CB format, upper and lower data limits are voltage range dependent. Because of the missing sign, CB format is used only for unipolar voltage ranges.

The following figure shows an example of raw binary output. When a 5 V signal is digitized by the module set for 0 to 10 V range, it produces a converted binary code 0800 hex or 2048 decimal.

Raw Binary Word Format

|    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| 0  | 0  | 0  | 0  | 1  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

The following figure shows the conditions in converted binary format which produce 1388 hex or 5000 decimal.

Converted Binary Word Format

|    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| 0  | 0  | 0  | 1  | 0  | 0  | 1 | 1 | 1 | 0 | 0 | 0 | 1 | 0 | 0 | 0 |

## B875–102 High Speed Analog Input, Communications with the PLC

### Input Ranges and Output Data Limits

As shown in the following table, data can be in either raw binary or converted binary format. Within the 2% maximum over-range margin allowed, no error code is reported to the PLC.

Input Ranges and Output Data limits

| Voltage range | Input Voltage | Raw Binary | Converted Binary |
|---------------|---------------|------------|------------------|
| 0—5 V         | 0.000         | 0000       | 0000             |
|               | 5.000         | 4096       | 5000             |
|               | 5.127 (max)   | 4200       | 5127             |
| 1—5 V         | 1.000         | 0000       | 1000             |

|               | 10.254 (max)  | 4200       | N/A              |
| -5—+5 V       | -5.000        | 0000       | Disallowed       |
|               | 0.0000        | 2048       | N/A              |
|               | 5.000         | 4096       | N/A              |
|               | 5.254 (max)   | 4200       | N/A              |
| -10—+10 V     | -10.000       | 0000       | Disallowed       |
|               | 0.000         | 2048       | N/A              |
|               | 10.000        | 4096       | N/A              |
|               | 10.508 (max)  | 4200       | N/A              |

### Diagnostic Communications

Diagnostic procedures are executed during the five second initialization period following power-up. Diagnostic routines are also run during wait states concurrent with executing A/D conversions. System diagnostics are: RAM checks, ROM checks, UART checks, as well as checking the legality of configuration switch settings and monitoring the ability to autocalibrate.

If the module fails to pass an internal diagnostic, two retries are made. If either one succeeds, the temporary lack of diagnostic is not reported to the PLC but the module system continues processing uninterrupted. If the module fails the diagnostic three times, the system goes into a power-up reset condition. switch settings and monitor

**NOTE:** While power-up diagnostics are running, or following detection of a hard failure, data is not available to the PLC.

**Good Data.** The following illustration shows status flags and data word format for good data to the PLC. When sending good data, status flag bits 14 and 15 are reset to 0.

Good Data Word Output to PLC

|    |    |                       |                 |    |    |   |   |   |   |   |   |   |   |   |   |
|----|----|-----------------------|-----------------|----|----|---|---|---|---|---|---|---|---|---|---|
| 15 | 14 | 13                    | 12              | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| 0  | 0  | 0                     | RAW BINARY DATA |    |    |   |   |   |   |   |   |   |   |   |   |
| 0  | 0  | CONVERTED BINARY DATA |                 |    |    |   |   |   |   |   |   |   |   |   |   |

**Out-of-range Data.** The following figure shows status flags and data word format of out-of-range data output to the PLC. When sending out-of-range data, status bit 14 will be reset to 0, bit 15 will be reset to 1, and the out-of-range indicator will illuminate.

Out-of-range Data Word Output to PLC

|    |    |                       |                 |    |    |   |   |   |   |   |   |   |   |   |   |
|----|----|-----------------------|-----------------|----|----|---|---|---|---|---|---|---|---|---|---|
| 15 | 14 | 13                    | 12              | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| 1  | 0  | 0                     | RAW BINARY DATA |    |    |   |   |   |   |   |   |   |   |   |   |
| 1  | 0  | CONVERTED BINARY DATA |                 |    |    |   |   |   |   |   |   |   |   |   |   |

**Out--of--Range** requires careful examination. Since the module receives instantaneous data from the field but sends averaged data to the PLC, instantaneous data less than 0 or greater than 4200 in RB format is considered out-of-range. Such data will be forced (clamped) to 0000 for under--range and 4200 for over-range values. However, the averaged data will not necessarily be out-of-range if the condition existed for less time than the total averaging period.

In this case, the format indicates at least one of the instantaneous data samples in the average is out of range. Its value for averaging purposes is the clamped value; the average may or may not be out of range. The red out-of-range light will remain on as long as an out-of-range data sample is included in the average.

## B875–102 High Speed Analog Input, Typical Circuit and Ground Connections

### Field Connections

The following illustration shows typical field circuitry connected to the field connector.

**NOTE:** Shields 1—8 are tied together internally and also to field side ground within the module. For grounded sources, a jumper to case ground must be externally supplied by the user.

# B875–102 High Speed Analog Input, Switch Settings

## Dip Switch Bank A

The high speed analog input module can be set for any of the five input voltage or current ranges by means of DIP switches. You can also select from seven periods of digital filtering; a feature which allows an instantaneous voltage sample to become part of a moving average. The DIP switches also set the module for 4 or 8 circuit mode and binary or decimal output.

For discussion purposes, we will designate the upper DIP switch bank, A (DIP sw-A) and lower bank, B (DIP sw-B). These switches are accessed through ports at the rear of the module.

The following illustration shows DIP sw-A as seen from the rear of the module. Dip sw-A is used for selecting an input range.

Dip switch bank A normal operation

Dip Switch Bank B

The following illustration shows sw-B. It is used to select input averaging.

DIP switch bank B-normal operation

**NOTE:** Both sw-A and sw-B follow the same switch setting conventions:

- on, closed, left, and logic "1" all mean the same.
- off, open, right, and "logic 0" all mean the same.
- The switch bank views shown are looking at the back of the module.

Setting Input Range

sw-A settings for all input ranges for both 8 and 4 input configurations, respectively, are shown in the following tables. sw-A has two functions in addition to input range setting

- Switch A7 is on for an 8-circuit configuration and off for a 4-circuit configuration
- Switch A8 must be on for normal operation

### Inputs Group A (8 Circuit Mode)

The following table describes the input ranges for group A (inputs 1 - 4):

| Input Range          | Switch | On | Off |
|----------------------|--------|----|-----|
| 1 - 5 V<br>4 - 20 mA | A-1    | X  |     |
|                      | A-2    | X  |     |
|                      | A-3    | X  |     |
| 0 - 10 V             | A-1    |    | X   |
|                      | A-2    | X  |     |
|                      | A-3    | X  |     |
| 0 - 5 V              | A-1    | X  |     |
|                      | A-2    |    | X   |
|                      | A-3    | X  |     |
| +/- 10 V             | A-1    |    | X   |
|                      | A-2    |    | X   |
|                      | A-3    | X  |     |
| +/- 5 V              | A-1    | X  |     |
|                      | A-2    | X  |     |
|                      | A-3    |    | X   |

**Inputs Group B (8 Circuit Mode)**

The following table describes the input ranges for group B (inputs 5 - 8):

| Input Range          | Switch | On | Off |
|----------------------|--------|----|-----|
| 1 - 5 V<br>4 - 20 mA | A-4    | X  |     |
|                      | A-5    | X  |     |
|                      | A-6    | X  |     |
| 0 - 10 V             | A-4    |    | X   |
|                      | A-5    | X  |     |
|                      | A-6    | X  |     |
| 0 - 5 V              | A-4    | X  |     |
|                      | A-5    |    | X   |
|                      | A-6    | X  |     |
| +/- 10 V             | A-4    |    | X   |
|                      | A-5    |    | X   |
|                      | A-6    | X  |     |
| +/- 5 V              | A-4    | X  |     |
|                      | A-5    | X  |     |
|                      | A-6    |    | X   |

### Inputs Group A (4 Circuit Mode)

The following table describes the input ranges for group A (inputs 1 - 2):

| Input Range          | Switch | On | Off |
|----------------------|--------|----|-----|
| 1 - 5 V<br>4 - 20 mA | A-1    | X  |     |
|                      | A-2    | X  |     |
|                      | A-3    | X  |     |
| 0 - 10 V             | A-1    |    | X   |
|                      | A-2    | X  |     |
|                      | A-3    | X  |     |
| 0 - 5 V              | A-1    | X  |     |
|                      | A-2    |    | X   |
|                      | A-3    | X  |     |
| +/- 10 V             | A-1    |    | X   |
|                      | A-2    |    | X   |
|                      | A-3    | X  |     |
| +/- 5 V              | A-1    | X  |     |
|                      | A-2    | X  |     |
|                      | A-3    |    | X   |

### Inputs Group B (4 Circuit Mode)

The following table describes the input ranges for group B (inputs 3 - 4):

| Input Range          | Switch | On | Off |
|----------------------|--------|----|-----|
| 1 - 5 V<br>4 - 20 mA | A-4    | X  |     |
|                      | A-5    | X  |     |
|                      | A-6    | X  |     |
| 0 - 10 V             | A-4    |    | X   |
|                      | A-5    | X  |     |
|                      | A-6    | X  |     |
| 0 - 5 V              | A-4    | X  |     |
|                      | A-5    |    | X   |
|                      | A-6    | X  |     |
| +/- 10 V             | A-4    |    | X   |
|                      | A-5    |    | X   |
|                      | A-6    | X  |     |
| +/- 5 V              | A-4    | X  |     |
|                      | A-5    | X  |     |
|                      | A-6    |    | X   |

### Setting Input Averaging

It is possible to compensate for spurious noise and other forms of amplitude modulation coming through the analog input filter by making the latest input sample part of a moving average—a form of digital filtering. This moving average technique has no affect upon the update interval.

The following tables show sw-B setting for selecting among seven input average sample periods for both 8 and 4 circuit configurations.

sw-B has other functions in addition to average sampling; switch B7 is set to on for binary code output or off for decimal code output for group A (inputs 1-4 in the 8 circuit mode and inputs 1-2 in the 4 circuit mode). Switch B8 does the same for group B.

### SW-B Settings Group A (8 Circuit Mode)

The following table describes sw-B Settings for all periods of input averaging (eight circuits) for group A (inputs 1 - 4):

| No. of samples averaged | Switch | On | Off |
|-------------------------|--------|----|-----|
| 1                       | B-1    | X  |     |
|                         | B-2    | X  |     |
|                         | B-3    | X  |     |
| 2                       | B-1    |    | X   |
|                         | B-2    | X  |     |
|                         | B-3    | X  |     |
| 4                       | B-1    | X  |     |
|                         | B-2    |    | X   |
|                         | B-3    | X  |     |
| 8                       | B-1    |    | X   |
|                         | B-2    |    | X   |
|                         | B-3    | X  |     |
| 16                      | B-1    | X  |     |
|                         | B-2    | X  |     |
|                         | B-3    |    | X   |
| 32                      | B-1    |    | X   |
|                         | B-2    | X  |     |
|                         | B-3    |    | X   |
| 64                      | B-1    | X  |     |
|                         | B-2    |    | X   |
|                         | B-3    |    | X   |

**SW-B Settings Group B (8 Circuit Mode)**

The following table describes sw-B Settings for all periods of input averaging (eight circuits) for group B (inputs 5 - 8):

| No. of samples averaged | Switch | On | Off |
|-------------------------|--------|----|-----|
| 1                       | B-4    | X  |     |
|                         | B-5    | X  |     |
|                         | B-6    | X  |     |
| 2                       | B-4    |    | X   |
|                         | B-5    | X  |     |
|                         | B-6    | X  |     |
| 4                       | B-4    | X  |     |
|                         | B-5    |    | X   |
|                         | B-6    | X  |     |
| 8                       | B-4    |    | X   |
|                         | B-5    |    | X   |
|                         | B-6    | X  |     |
| 16                      | B-4    | X  |     |
|                         | B-5    | X  |     |
|                         | B-6    |    | X   |
| 32                      | B-4    |    | X   |
|                         | B-5    | X  |     |
|                         | B-6    |    | X   |
| 64                      | B-4    | X  |     |
|                         | B-5    |    | X   |
|                         | B-6    |    | X   |

### SW-B Settings Group A (8 Circuit Mode)

The following table describes sw-B Settings for all periods of input averaging (eight circuits) for group A (inputs 1 - 2):

| No. of samples averaged | Switch | On | Off |
|-------------------------|--------|----|-----|
| 1                       | B-1    | X  |     |
|                         | B-2    | X  |     |
|                         | B-3    | X  |     |
| 2                       | B-1    |    | X   |
|                         | B-2    | X  |     |
|                         | B-3    | X  |     |
| 4                       | B-1    | X  |     |
|                         | B-2    |    | X   |
|                         | B-3    | X  |     |
| 8                       | B-1    |    | X   |
|                         | B-2    |    | X   |
|                         | B-3    | X  |     |
| 16                      | B-1    | X  |     |
|                         | B-2    | X  |     |
|                         | B-3    |    | X   |
| 32                      | B-1    |    | X   |
|                         | B-2    | X  |     |
|                         | B-3    |    | X   |
| 64                      | B-1    | X  |     |
|                         | B-2    |    | X   |
|                         | B-3    |    | X   |

**SW-B Settings Group B (8 Circuit Mode)**

The following table describes sw-B Settings for all periods of input averaging (eight circuits) for group B (inputs 3 - 4):

| No. of samples averaged | Switch | On | Off |
|-------------------------|--------|----|-----|
| 1                       | B-4    | X  |     |
|                         | B-5    | X  |     |
|                         | B-6    | X  |     |
| 2                       | B-4    |    | X   |
|                         | B-5    | X  |     |
|                         | B-6    | X  |     |
| 4                       | B-4    | X  |     |
|                         | B-5    |    | X   |
|                         | B-6    | X  |     |
| 8                       | B-4    |    | X   |
|                         | B-5    |    | X   |
|                         | B-6    | X  |     |
| 16                      | B-4    | X  |     |
|                         | B-5    | X  |     |
|                         | B-6    |    | X   |
| 32                      | B-4    |    | X   |
|                         | B-5    | X  |     |
|                         | B-6    |    | X   |
| 64                      | B-4    | X  |     |
|                         | B-5    |    | X   |
|                         | B-6    |    | X   |

# B875–102 High Speed Analog Input, Indicators

## Overview

The following standard front-panel indicators reflect module communication status with the controller and provide an indication of field-side signal status.

Indicator status summary table

| Indicator    | State    | Condition                                                                                            |
|--------------|----------|------------------------------------------------------------------------------------------------------|
| Active       | on       | The module is communicating properly with the PLC                                                    |
|              | off      | The module failed the internal diagnostic test, which determines if valid communication is possible. |
| Out of Range | off      | All inputs are within the valid input range.                                                         |
|              | blinking | One or more inputs are outside the valid input range.                                                |

The I/O map for an eight-circuit configuration (B875) and four-circuit configuration (B873) looks alike.

## B875–102 High Speed Analog Input, Recalibration

### Overview

Since the module is shipped factory-calibrated, it is the designer's intention that the 10 V reference voltage adjustment will be good for one year. It should be recalibrated annually thereafter.

The following tools are needed to adjust the module's reference voltage:

- A precision digital readout voltmeter with an accuracy of 0.0001 V on a 10 V scale: 6-1/2 digits, to guarantee 4 bit count accuracy.
- A 1/8-inch bit, thin-blade screwdriver.
- A small-bit Phillips-head screwdriver.
- An adhesive (such as Loctite or Glyptol) to secure trim-pot adjustment screws.

**NOTE:** Field wiring may remain connected during the recalibration procedure, as the module's working state is not interactive with the reference voltage adjustment. Also, the module does not require warmup to attain temperature.

### Recalibration Procedure

Use the following table to recalibrate the module.

| Step | Action                                                                                                                                 |
|------|----------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Refer to illustration of reference voltage cover removal, below. Remove reference voltage adjustment cover to gain access to trim pot. |
| 2    | Connect DVM as shown in reference voltage adjustment circuit illustration, below.                                                      |
| 3    | Adjust reference voltage trim pot for exactly 10.0000 V.                                                                               |
| 4    | Secure trim pot with adhesive.                                                                                                         |
| 5    | Disconnect voltmeter and secure trim pot access cover.                                                                                 |
| 6    | Remove power from equipment housing.                                                                                                   |

## B875-102 High Speed Analog Input, Installation

### Overview

Module installation involves the following: unpacking the module; setting up the configuration switches; installing key pins in the housing; mounting the module in the housing; wiring the connector.

### Installation Procedure

Use the following table to install the module.

| Step | Action                                                                                                                                                                                                                                                                                                         |
|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Remove module from shipping box and check for damage. If damage found, contact distributor (or sales person) for correct return procedure.                                                                                                                                                                     |
| 2    | Ensure that power is removed from housing.                                                                                                                                                                                                                                                                     |
| 3    | Configure switch bank A as follows: <ul style="list-style-type: none"> <li>● A-1 through A-6 for desired input voltage ranges appropriate to the intended eight- or four-circuit configuration</li> <li>● A7 to select eight- or four-circuit input mode.</li> <li>● A8 to ON for normal operation.</li> </ul> |
| 4    | Configure switch bank B as follows: <ul style="list-style-type: none"> <li>● B-1 through B-6 for desired number of input averaging samples appropriate to eight- or four-circuit configuration designated above.</li> <li>● B7 to select output code format</li> </ul>                                         |
| 5    | If using key pins (provided with housing shipment), install them above and below housing slot selected for this module's installation.                                                                                                                                                                         |
| 6    | Open handle and insert module into housing, firmly seating edge connector in backplane.                                                                                                                                                                                                                        |
| 7    | Secure module using captive mounting screws at top and bottom of module's front panel.                                                                                                                                                                                                                         |
| 8    | Refer to field connector/input circuit pinout diagram, below. Connect field side wiring to double field connector (located on left side, front edge), laying in cable fan-out as desired.<br><b>NOTE:</b> Use field connector wiring sizes AWG—20 inclusive (solid or stranded).                               |

| Step | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9    | <p>If current sense input circuit(s) is being used, jumper appropriate current sense terminal on field connector to corresponding hot input (+) as shown in field connector/input circuit pinout diagram, below.</p> <p><b>NOTE:</b> Unused inputs should be terminated to reduce electrical noise and other interference due to floating input lines. Jumper unused voltage and current terminals (including shields) to case ground. Case ground will only be effective if H8XX housing is connected to earth ground. Both ends of the shield cannot be connected to the device and module, unless the device shield is part of the device input circuit, and is not connected internally to the device case ground.</p> <p><b>NOTE:</b> If over-range and under-range detection is required, and this detection is causing throughput problems with the unused channels (because they float or spike outside the range) then the unused voltage or current channels at the field connector should be connected in parallel to a valid input channel. As long as the valid channel stays within range, the tied channels will also stay within range.</p> <p><b>NOTE:</b> For currents within the range of 4—20 mA, only the valid input requires the inclusion of the 250 <math>\Omega</math> resistor.</p> |
| 10   | <p>Refer to field connector mounting drawing, below. Mount two wired field connectors on analog module with pin 1 positioned at top and field wiring to left.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 11   | <p>Close module handle.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 12   | <p>Turn on power to housing if desired.</p> <p><b>NOTE:</b> If an open circuit occurs when operating in the voltage mode, the input may take several seconds to decay to zero, due to the front-end RC network. If open-circuit detection is required, the module should be operated in the current mode. The addition of the 250 <math>\Omega</math> resistor forces the RC network to discharge rapidly.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## B875–102 High Speed Analog Input, Specifications

### Specification Table

The following table provides the specifications for the unit.

| B875-102 Specifications |                 |                                                       |
|-------------------------|-----------------|-------------------------------------------------------|
| Description             |                 | Fast A/D voltage or current input                     |
| Number of Channels      | B873/B875       | Four or eight isolated inputs                         |
| Operating Range         | Voltage         | 1—5 Vdc                                               |
|                         |                 | 0—5 Vdc                                               |
|                         |                 | 0—10 V                                                |
|                         |                 | -5—+5 V                                               |
|                         |                 | -10—+10 V                                             |
|                         | Current         | 4—20 mA                                               |
|                         |                 | 0—20 mA                                               |
|                         |                 | 0—40 mA                                               |
|                         |                 | -20—+20 mA                                            |
|                         |                 | -40—+40 mA                                            |
| Impedance               | Voltage Mode    | >10 M $\Omega$ input differentially                   |
|                         |                 | 1.5 k $\Omega$ with power removed                     |
|                         | Current Mode    | 250 $\Omega$ /input                                   |
| Resolution              |                 | 12 bit                                                |
| Filter                  |                 | Single Pole dc to 1.0 kHz                             |
| Linearity               | Error           | .05% of full scale over operating temperature range   |
|                         | Differential    | 0.0244% of full scale @ 25°C (77°F)                   |
| Protection              |                 | 120 Vac differential input (voltage mode only)        |
| Common Mode             | Range           | Input voltage plus common mode voltage less than 12 V |
|                         | Rejection       | >-70 dB, dc to 60 Hz                                  |
| Isolation               | Input to Case   | 1500 Vac RMS for i minute                             |
|                         | Input to Input  | 30 Vdc                                                |
|                         | Input to OURBUS | 1500 Vac RMS for 1 minute                             |
| Accuracy                | @25°C (77°F)    | 0.1% of full scale (4 counts)                         |
|                         | Over 0—60°C     | 0.25% Of full scale (10 counts)                       |
| Terminal Connector      |                 | AS-8533-004                                           |

| B875-102 Specifications |                |                                                                                                            |
|-------------------------|----------------|------------------------------------------------------------------------------------------------------------|
| Repeatability           |                | 0.25% of full scale (10 counts) of full scale RMS, constant temperature, no averaging                      |
| Autocalibration         |                | High/low range points recalibrated during run time                                                         |
| Power-up Time           |                | 5 s maximum                                                                                                |
| Warm-up Time            |                | 5 s concurrent with power-up)                                                                              |
| Power Required          | +5 V           | 650 mA max, 300 mA typical                                                                                 |
|                         | +4.3 V         | 975 mA max, 550 mA typical                                                                                 |
|                         | -5 V           | 0 mA                                                                                                       |
| Data Format             | 0000           | Power Up                                                                                                   |
|                         | 8000 Hex       | Out of Range                                                                                               |
|                         | 0001—4200      | Valid—All Ranges                                                                                           |
|                         | 9068 Hex       | Over Range                                                                                                 |
| Data Update Period Rate | Four channels  | 2.4 ms                                                                                                     |
|                         | Eight channels | 3.0 ms (including diagnostics). No additional time penalty for process or data for out-of-range condition. |
| Reference Type          |                | Mapped as 8 registers input 3x                                                                             |
| Input Type              |                | BIN/BCD                                                                                                    |

# Chapter 9

## B875-111 and B877-111 Analog Input

---

### Purpose

This chapter describes the functional and physical characteristics of the B875-111 and B877-111 analog input modules.

### What Is in This Chapter?

This chapter contains the following topics:

| Topic                                               | Page |
|-----------------------------------------------------|------|
| B875–111 Analog Input, Overview                     | 152  |
| B875–111 Analog Input, Module Configuration         | 154  |
| B875–111 Analog Input, Field Connections            | 158  |
| Module B875–111 Analog Input, Quick Start Test      | 163  |
| B875–111 Analog Input, Application Example          | 164  |
| B875–111 Analog Input, Calibration                  | 170  |
| B875–111 Analog Input, Quick Reference              | 173  |
| B875–111 Analog Input, Specifications               | 174  |
| B875-111 Parameter Configuration                    | 176  |
| B877-111 Parameter Configuration                    | 177  |
| B877–111, Terminal Numbering and Output Connections | 178  |

## B875–111 Analog Input, Overview

### General Characteristics

The B875–111 analog-to-digital (A/D) input module (B875) converts input voltage and/or input current ranges into binary data. This module can be configured to accept 8 differential or 16 single ended inputs. When selected for 8 differential inputs, the card is called a B875–111. When selected for 16 single ended inputs, the card is called a B877–111. Refer to the simplified schematic below.

The B875 analog input module allows the polling of a wide array of field devices requiring different voltages and different currents based upon a unique application. One can select from five available input voltage ranges on a module-wide basis. The ranges, which are 0 to 5 V, 1 to 5 V, –5 to 5 V, 0 to 10 V, and –10 to 10 V, are selected by means of four DIP switches on the module configuration switch.

One can select from three available input current ranges, which are 0 to 20 mA, 4 to 20 mA, and –20 to +20 mA.

One can select from four available output formats. The formats, which are standard, elevated, full resolution, and decimal, are selected by means of two DIP switches on the module configuration switch.

One can select either no averaging, or 8, 16, or 32 sample inputs to be averaged to generate each output by means of two DIP switches on the module configuration switch.

The module has eight/sixteen analog inputs and is capable of updates to all channels every 10–20 msec. The greater than 12-bit resolution and the absolute accuracy of 0.1% at 0–60° C provides precise control of the application.

## Simplified Block Diagram

The following illustration represents the simplified schematic diagram for the B875-111 module.

B875-111 Analog input module, simplified schematic diagram

## B875–111 Analog Input, Module Configuration

### Overview

The B875-111 module is shipped from the factory with the 1—5 V range with 0—4095 output format (standard), one sample averaged, and voltage inputs, 8 channel (B875-111)—i.e., all DIP switches to the right. If necessary, reset the module configuration switch and the five-position DIP switch based upon the application requirements prior to installation.

Refer to the illustration of the module configuration switch, below.

### Module Configuration Switch with DIP Switches

The following illustration shows the module configuration switch and DIP switch settings for the B875–111 module.

B875–111 analog input module, module configuration switch and DIP switch settings

Use the following table to determine the functions for each switch.

| Switches  | Functions                                                     |
|-----------|---------------------------------------------------------------|
| SW1       | Input Range                                                   |
|           | For Bipolar ( 10 V, 5 V 20 mA):SW1=L                          |
|           | For Unipolar (0—10 V, 0—5 V, 0—20 mA, 1—5 V, 4—20 mA): SW1=R  |
| SW2       | Input Range                                                   |
|           | For Offset (1—5 V or 4—20 mA): SW2=R                          |
|           | For No Offset (All other Ranges): SW2=L                       |
| SW3 & SW4 | Output Formats (refer to the following table for resolutions) |
|           | For Standard (0000—4095): both SW3 and SW4=R                  |
|           | For Elevated (4096—8191): SW3=L and SW4=R                     |
|           | For Full Resolution (Raw Binary): SW3=R and SW4=L             |
|           | For Decimal (0001—9999): both SW3 and SW4=L                   |
| SW5 & SW6 | Samples to Averaged                                           |
|           | For 1 Sample: SW5 and SW6 both R                              |
|           | For 8 Samples: SW5=L and SW6=R                                |
|           | For 16 Samples: SW5=R and SW6=L                               |
|           | For 32 Samples: SW5 and SW6 both L                            |
| SW7       | Input Types                                                   |
|           | For 8 Differential (B875):SW7=R                               |
|           | For 16 Single Ended (B877): SW7=L                             |
| SW8       | Input Ranges                                                  |
|           | For 10 V (10 V or 0—10 V): SW8=L                              |
|           | For 5 V (All Others): SW8=R                                   |

## Output Format Selection

The following table provides the output formats and their resolution relationships:

| Output Format                                                                                                                    | Under Range          | Normal Range                   | Over Range           | Resolution                                                               | Actual Format                                              |
|----------------------------------------------------------------------------------------------------------------------------------|----------------------|--------------------------------|----------------------|--------------------------------------------------------------------------|------------------------------------------------------------|
| Standard                                                                                                                         | 0000                 | 0000—4095                      | 4096                 | 12 bits                                                                  | Raw binary, unsigned                                       |
| Elevated                                                                                                                         | 4095                 | 4096—8191                      | 8192                 | 12 bits                                                                  | Raw binary, unsigned                                       |
| Full Resolution                                                                                                                  | Bit 16=1<br>Bit 15=1 | Bit 16=0<br>Bit 15=0<br>1—7499 | Bit 16=1<br>Bit 15=0 | Bipolar=1/15000 counts<br>Unipolar=1/7500 counts<br>Offset=1/6000 counts | *Raw binary and two flags                                  |
| Decimal                                                                                                                          | Bit 16=1<br>Bit 15=1 | Bit 16=0<br>Bit 15=0<br>1—9999 | Bit 16=1<br>Bit 15=0 | Bipolar=1/1000 counts<br>Unipolar=1/7500 counts<br>Offset=1/6000 counts  | Raw binary and two flags<br>1—9999 counts<br>1—9999 counts |
| *When an under or over range condition exists, the output word contains the applicable flag and the under or out-of-range value. |                      |                                |                      |                                                                          |                                                            |

Standard output format is raw binary output, 0—4095 counts. Under range is 0000 and over range is 4096.

Elevated output format is raw binary output, 4096—8191 counts. Under range is 4095 and over range is 8192.

Full resolution output format provides the true resolution of the module which depends on the input range.

- Bipolar inputs produce an output of 0001—14,999 counts
- Unipolar inputs produce an output of 0001—7499 counts
- Unipolar and offset inputs produce an output of 0001—5999 counts

In the full resolution format, out-of-range values of 2.4% may be read to the specified accuracy of the module. They can be read in this manner. When an out-of-range condition occurs which is over range the MSB (bit 16) is set to 1. If an under range occurs the second MSB (bit 15) is also set to 1. The remaining 14 bits give the absolute value of the amount over or under range. For example, for a unipolar input of 5.120 volts the output would have bit 16 set to 1. The remaining output bits equaling the raw binary representation of 120 millivolts. Any input above the 0.120 volts in this range will not be within the specified accuracy of the module.

Decimal output format allows scaled outputs to provide 0001—9999 counts full scale. This format does not indicate the true resolution of the module. For bipolar inputs the output is scaled down and for unipolar inputs the output is scaled up. This format also reports out-of-range values in the same manner as the full resolution mode.

**NOTE:** For unipolar and unipolar with offset image ranges, the process of scaling the lower resolution output values to the 1—9999 output format creates the possibility of missing codes due to rounding off of numbers in the micro controller.

**NOTE:** When applying power to the equipment, or after a reset, the module transfers 4000 Hexadecimal during its internal reset, and initialization time until valid data is ready to be transferred. (4000 Hexadecimal corresponds to the second MSB=1, all other bits=0).

### Input Selection

First, locate the four access holes on the left side of the module. These holes allow access to three four-position and one five-position DIP switch.

Next, set switch position 5 (SW5) of the five-position DIP switch found in the bottom access hole on the left side of the module, to select the input range. This switch must correspond to switch position 8 (SW8) of the eight-position module configuration DIP switch. SW5 and SW8 settings must be identical.

**NOTE:** For switch SW5, the input ranges are as follows:

- For 10 V (10 V or 0—10 V) place SW5 to the left.
- For 5 V (all others) place SW5 to the right.

## B875–111 Analog Input, Field Connections

### Overview

There are two ways to configure the module to accept current inputs. With eight differential current/voltage inputs the module is called the B875-111. With sixteen single-ended current/voltage inputs the module is called the B877-111.

### B875-111 field connections

When configuring the B875-111 for eight differential current inputs, note the channels that will receive these inputs. Current inputs are selected by placing a jumper on the field connector between the positive voltage input and the current input terminal for the appropriate channel. For example, if channel 2 is to receive a current input, a jumper must be made between terminal #7 (CH2+) and terminal #6 (CH2-), as shown on the following illustration.

The following illustration represents the simplified schematic diagram for the B875–111 module.

B875–111 analog input module, current input example drawing

**NOTE:** DIP switch accessibility

DIP switches accessible through the side cover are not used in differential mode and should be left in the factory-installed voltage input positions.

**NOTE:** Simultaneous current and voltage inputs can exist under the following conditions:

- 1—5 V and 4—20 mA
- 0—5 V and 0—20 mA
- 5 and 20 mA

Connect field-side wiring to proper pins on the field connector. Voltage inputs do not require a jumper on the field connector. Refer to the illustration showing the typical field circuit connections, below.

**NOTE:** Open-circuit voltage inputs may drift either positive or negatively. If open-circuit detection is required, a current input should be used. When using voltage inputs, an open circuit can be detected if a large-value resistor (2 M $\Omega$  or greater) is placed at the field connector across the positive (+) and negative (-) inputs. The resistor clamps the channel to a small offset voltage (<100 mV) if the field connections are broken.

## Typical field circuit connections with eight differential inputs

\*For reference only. Do not attach field wiring.

- ① Shields 1-8 are common and tied to field side ground.
- ② Jumper unused channels in parallel with a valid input to avoid out of range errors.
- ③ When terminating unused channels in current mode, do not jumper the "current input" pin of the unused channel.
- ④ When using shielded field circuit wires, ground shield at one end only.

**B877-111 Field Connections**

Current inputs are selected by setting the DIP switches accessible through the side cover for each channel to receive an input. The DIP switch places a 250 Ω precision resistor between the positive input and analog returns.

The fifth switch (SW5) on switch bank 4, located on the left side selects the voltage range. The position of this switch must be the same as for module configuration switch SW8, located at the rear of the module. Refer to the label located on the left side of the module, and to the illustration showing the current settings for single-ended inputs (B877) below.

Current settings for single-ended inputs, diagram (B877)

Use the following table to determine the functions for each switch.

| Switches      | Functions                                   |
|---------------|---------------------------------------------|
| Switch Bank 1 | Current Inputs                              |
|               | For Channels 1—4                            |
|               | SW1—4=Right Side Down                       |
| Switch Bank 2 | Current Inputs                              |
|               | For Channels 5—8                            |
|               | SW1—4=Right Side Down                       |
| Switch Bank 3 | Current Inputs)                             |
|               | For Channels 9-12                           |
|               | Sw1—4=Right Side Down                       |
| Switch Bank 4 | Current Input                               |
|               | For Channels 13—16                          |
|               | SW1—4=Right Side Down                       |
| Switch Bank 5 | Input Ranges                                |
|               | For 10 V ( V or 0—10 V): SW5=Left Side Down |
|               | For 5 V (All Others): SW5=Right Side Down   |

**NOTE:** DIP switch accessibility

DIP switches accessible through the side cover are not used in differential mode and should be left in the factory-installed voltage input positions.

Use the following table to field connect the B77-111 module. Refer to typical field circuit connections, single-ended inputs (B877) diagram, below.

| Step | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Connect field-side wiring to proper pins on field connector when module is configured for sixteen single-ended inputs.<br><b>Note:</b> Open-circuit voltage inputs may drift either positive or negatively. If open-circuit detection is required, a current input should be used. When using voltage inputs, an open circuit can be detected if a large-value resistor (2 MΩ or greater) is placed at the field connector across the positive (+) and negative (-) inputs. The resistor clamps the channel to a small offset voltage (<100 mV) if the field connections are broken. |
| 2    | Reinstall any module temporarily removed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 3    | When using key pins (provided with housing shipment), install them above and below housing slot selected for this module's installation.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 4    | Insert module into housing firmly but carefully, seating edge connector in backplane.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 5    | Secure module to housing using captive slotted mounting screws at top and bottom of module front panel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Typical field circuit connections, single-ended inputs (B877) diagram

\*For reference only. Do not attach field wiring.

- ① All returns are electrically tied together inside the module.
- ② Jumper unused channels in parallel with a valid input to avoid out of range errors.  
You must select a voltage mode for the unused channel.
- ③ When using shielded field circuit wires, ground shield at one end only.

## Module B875–111 Analog Input, Quick Start Test

### Overview

The quick-start test configures a B875-111 eight-channel differential module as follows: 0—10 V input range; 0—4096 counts output format; no sample averaging. Use the following table to perform the quick-start test.

| Step      | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                     |          |           |     |       |                         |     |      |                                     |           |       |                              |           |       |                      |     |       |                          |     |      |                     |

Turn power off, insert module and reapply power.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                     |          |           |     |       |                         |     |      |                                     |           |       |                              |           |       |                      |     |       |                          |     |      |                     |

## B875–111 Analog Input, Application Example

### Setup

#### Configuration switch pack

The B875–111 can be configured to accept 8 differential or 16 single ended inputs. When selected for 8 differential inputs, the card is called a B875–111. When selected for 16 single ended inputs, the card is called a B877–111.

This selection is made by switch 7 on the configuration switch pack found at the rear of the module. SW7 in the left position is equal to 16 inputs, in the right position it is equal to 8 inputs.

In addition to selecting the number of inputs, you also select voltage range, output format, polarity, offset and number of samples. Refer to the installation instructions and the DIP-switch chart on the left side of the module for details.

For a quick start setup, use the following settings to interface a 0 to +10 V input signal. For the following input parameters:

- 0—10 V input
- 0 to full scale output format
- One sample
- Eight differential inputs

Set the switch settings as follows:

- SW1, SW3, SW5, SW7=right
- SW2, SW4, SW6, SW8=left

#### Input type selection (voltage or current)

If configured as a B875 (8 differential inputs), current inputs (4—20 mA) are selected by placing a jumper at the field connector between the positive voltage input and the current input terminal for the appropriate channel. Refer to the following illustration.

Field connector jumper diagram

If configured as a B877 (16 single ended current inputs), input type is selected by the switches on the left side of the module. There is one switch for each of the 16 inputs. This switch places a 250  $\Omega$  precision resistor between the plus input and analog return. External jumpers are not used and must be removed. The left position is equal to voltage input, and the right position is equal to current input.

The fifth switch on switch bank 4 (left side) selects the voltage range for both B875 and B877 operations. This switch must correspond to switch 8 of the configuration switch bank (at rear of module). The left position of SW5 is equal to 10 volts, and the right position is equal to 5 volts. SW8 must be in the same position as SW5.

For the 0—10 V input signal example, set all the input switches to the left (down or towards the numbers).

### I/O Mapping

If setup for 8 differential inputs, the module type will be a B875 and requires 8 consecutive 3xxx binary registers. If setup for 16 single ended inputs, the module type will be a B877 and require 16 consecutive 3xxx binary registers.

**NOTE:** Upon power-up the module's active indicator flashes rapidly showing that communication with the programmable controller has been established but, that the input data being returned is not valid. (4000 Hexadecimal is sent to the controller during the initialization time). When module initialization is complete, and valid input data is being transferred, the indicator is either steady on, or flashing slowly when any input is out-of-range.

### Wire Inputs

The B875-111 and B877-111 require a high-density connector, part number AS-8535-000. Refer to the left side of the module for pinouts. Refer to the following illustration.

0—10 V input example.

### Module Checkout

The B875-111 and B877-111 will perform an analog to digital conversion on the inputs. The resolution of the analog to digital conversion is dependent upon the input range and output format selected with the configuration switch bank.

Using a programmer, call up the appropriate registers assigned in the I/O Map. Vary the input signal and check that the register content varies correctly.

Refer to the following table for the quick-start example.

| Voltage | Value                                                                                                            |
|---------|------------------------------------------------------------------------------------------------------------------|
| @ 0 V   | 3xxxx=001 (decimal)                                                                                              |
| @ 5 V   | 3xxxx=3750                                                                                                       |
| @ 10 V  | 3xxxx=7500                                                                                                       |
| @ 11 V  | 3xxxx > 9999 (decimal)*<br>*The active light indicator should be flashing, indicating the input is out of range. |

## Sample Averaging Input Data

The output data can be processed by a low-pass digital filter in the module to average out and remove any low-frequency noise in the converted input analog data. The digital filter algorithm is:

$$Y_n = Y_{n-1} + \frac{X_n - Y_{n-1}}{2N}$$

where

X<sub>n</sub> = Current input data sample

Y<sub>n</sub> = New output filter data value

Y<sub>n-1</sub> = Previous output filter data value.

The digital filter algorithm approximates a classical exponential response characteristic with both the cut-off frequency, F<sub>c</sub>, and the time constant, T<sub>c</sub>, related to the number of samples to be averaged, N, and the throughput time, T. The "N" is user selected (8,16,32) with DIP-switches. Throughput time,"T", equals 10 ms for the B875-111, and 20ms, for the B877-111.)

$$T_c = 2 \times N \times T \quad (s)$$

$$F_c = \frac{1}{2 \times \text{Pi} \times T_c} = \frac{.08}{N \times T} \quad (\text{Hz})$$

where Pi = 3.141

As with any filter, the user must establish what time constant and cut-off frequency is suitable for the specific application. Below is a reference table that approximates the digital filter characteristics for various user settings.

Digital filter approximates (B875-111)

| Throughput Time (T) | Number of Samples (N) | Cut-off Frequency (F <sub>c</sub> ) | Time Constant (T <sub>c</sub> ) |
|---------------------|-----------------------|-------------------------------------|---------------------------------|
| 10 ms               | 8                     | 1 Hz                                | 160 ms                          |
| 10 ms               | 16                    | 0.5 Hz                              | 320 ms                          |
| 10 ms               | 32                    | 0.25 Hz                             | 1640 ms                         |

Digital Filter Approximates (B877-111)

| Throughput Time (T) | Number of Samples (N) | Cut-off Frequency (F <sub>c</sub> ) | Time Constant (T <sub>c</sub> ) |
|---------------------|-----------------------|-------------------------------------|---------------------------------|
| 20 ms               | 8                     | 0.5 Hz                              | 320 ms                          |
| 20 ms               | 16                    | 0.25 Hz                             | 640 ms                          |
| 20 ms               | 32                    | 0.125 Hz                            | 1280 ms                         |

Approx. step settling-time to 63% of final value = 1 x T<sub>c</sub>

Approx. step settling-time to 99% of final value = 4.5 x T<sub>c</sub>

Approx. step settling-time to 99.9% of final value = 6.8 x T<sub>c</sub>

**NOTE:** As the scan time increases, the average response time may decrease as viewed in ladder logic.

### Application

In many applications, analog signals are provided to operators in units (points, gallons per second, degrees C, feet per minute, etc.) via LED displays, CRT monitors or report printouts. An analog input can be scaled to engineering units.

To illustrate the technique, assume that the 0—10 V signal in the quick-start example represents a temperature from -40—+140°F. Refer to the following illustration showing the signal to temperature relationship.

Signal to temperature relationship diagram

- What is the engineering unit range? In this example it is  $140 - (-40) = 180$
- Divide this number by 7500 using a calculator.  $180/7500 = .024$
- Multiply this number by 10,000 to obtain the multiply block constant of 240.
- Multiply the analog input by 240. The high-order result register will contain the range.
- Add or subtract the Y intercept (-40 in this example) to obtain the answer.

Scaled value from analog signal, diagram

**NOTE:** The logic shown is used to generate the scaled value in register 40020 from the analog signal in 3001. For example: 30001 = 3800; 40020 = 0051°F

**NOTE:** Only the high-order result of the multiplication is used, and no compensation for round-off is used in this example.

## B875–111 Analog Input, Calibration

### Calibration Tools

The analog input module is calibrated at the factory prior to shipment. To ensure the module's accuracy, the trim-pot should be calibrated regularly on a yearly interval.

The following tools and materials are needed to calibrate an analog input module:

- A precision digital readout voltmeter with an accuracy of 0.0001 V on a 10 V scale.
- A 1/8-inch bit, thin-blade screwdriver.
- A 1/4-inch Phillips-head screwdriver.
- An adhesive (such as Loctite or Glyptol) to secure trim-pot adjustment screws.

### Calibration Procedure

Use the following table to calibrate the module.

| Step | Action                                                                                                                                                                                                                                                                                                                                       |
|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Remove two screws and label located on front-panel of analog input module to allow access to trim pot.<br><b>Note:</b> The trim pot adjusts the total magnitude of the range (full scale). Refer to trim-pot location diagram, below.                                                                                                        |
| 2    | Open analog input module handle to expose connectors and terminals.                                                                                                                                                                                                                                                                          |
| 3    | Connect digital voltmeter (DVM) minus lead to voltage reference - (terminal number 38) and plus lead to voltage reference + (terminal number 39). Refer to voltmeter connection diagram, below.<br><b>Note:</b> Field wiring may remain connected during calibration. Five minutes of warm-up is sufficient to attain temperature stability. |
| 4    | Adjust reference voltage trim pot for an indication of 4.500 V 0.0001 V.                                                                                                                                                                                                                                                                     |
| 5    | Secure trim pot in place with adhesive.                                                                                                                                                                                                                                                                                                      |
| 6    | Disconnect voltmeter, return connections to their pre-calibration state, close module handle. Replace front label removed in step 1, above.                                                                                                                                                                                                  |

## B875—111 Analog Input, Quick Reference

### Overview

To set up the analog input module properly, an eight-position DIP-switch must be set together with SW5 of a five-position DIP switch located on the left side of the module. These switches determines the input range, output format, number of samples to be averaged, and the types of inputs.

DIP-switch configuration parameters, Table

| DIP-Switch Configuration Parameters |                                 | Eight-Position Switch |     |     | Five-Position Switch |
|-------------------------------------|---------------------------------|-----------------------|-----|-----|----------------------|
| Input Range                         |                                 | SW1                   | SW2 | SW8 | SW5                  |
|                                     | 5 V, 20 mA                      | L                     | L   | R   | R                    |
|                                     | 0—5 V, 0—20 mA                  | R                     | L   | R   | R                    |
|                                     | 1—V, 4—20 mA                    | R                     | R   | R   | R                    |
|                                     | 10 V                            | L                     | L   | L   | L                    |
|                                     | 0—10 V                          | R                     | L   | L   | L                    |
| Output Format                       |                                 | SW3                   | SW4 |     |                      |
|                                     | Standard (0—4096)               | R                     | R   |     |                      |
|                                     | Elevated (4096—8192)            | L                     | R   |     |                      |
|                                     | Variable (0 to full resolution) | R                     | :   |     |                      |
|                                     | Decimal (0—10,000)              | L                     | L   |     |                      |
| Samples to be Averaged              |                                 | SW5                   | SW6 |     |                      |
|                                     | 1 or no averaging               | R                     | R   |     |                      |
|                                     | 8                               | L                     | R   |     |                      |
|                                     | 16                              | R                     | L   |     |                      |
|                                     | 32                              | L                     | L   |     |                      |
| Types of Inputs                     |                                 | SW7                   |     |     |                      |
|                                     | 8 Differential                  | R                     |     |     |                      |
|                                     | 16 Single-ended                 | L                     |     |     |                      |

For example, assume that the following values are desired: 5 V input; 0—10,000 counts output; no averaging; differential inputs. Set the switches as follows:

Module Configuration Switch

SW1—4 = L

SW5—8 = 8

Switch Bank 4

SW5 = R

## B875–111 Analog Input, Specifications

### Specification Table

The following table provides the specifications for the unit.

| B875-111 Specifications     |                        |                                                                 |
|-----------------------------|------------------------|-----------------------------------------------------------------|
| Analog Inputs/Module        | I/O mapped as B875-111 | Eight differential                                              |
|                             | I/O mapped as B877-111 | 16 Single-ended                                                 |
| Input Ranges                | Voltage                | 1—5 Vdc                                                         |
|                             |                        | 0—5 Vdc                                                         |
|                             |                        | 0—10 V                                                          |
|                             |                        | -5—+5 V                                                         |
|                             |                        | -10—+10 V                                                       |
|                             | Current                | 4—20 mA                                                         |
|                             |                        | 0—20 mA                                                         |
|                             |                        | -20—+20 mA                                                      |
| Input Analog Filter         |                        | Single pole low pass, with -3 dB cut-off frequency at 48 Hz 10% |
| Input Resistance            | Current Mode           | 250 Ω, 0.05%                                                    |
|                             | Voltage Mode           | Within range > 10 MW, outside range 10,000 Ω                    |
| Input Resistance (No power) | Differential Inputs    | 20kΩ /channel                                                   |
|                             | Single-ended Inputs    | 10 kΩ/channel                                                   |
| Input Protection            | Normal Mode            | 120 V RMS differential input                                    |
|                             | Common Mode            | 120 V RMS                                                       |
| Throughput (T)              | eight channels         | 10 ms without input sampling                                    |
|                             | 16 channels            | 20 ms without input sampling                                    |
| Over Current Protection     |                        | Up to 30 mA                                                     |
| Common Mode Range           |                        | 2 V for 10 V, 7 V for 5 V                                       |
| Rejection                   |                        | -40 dB typical, dc to 60 Hz                                     |
| Input Isolation             | Input to OURBUS        | 1500 Vac RMS for 1 minute                                       |
|                             | Input to Case          | 1500 Vac RMS for 1 minute                                       |
|                             | Input to Input         | 25 Vac                                                          |

| B875-111 Specifications      |                      |                                                                                                    |
|------------------------------|----------------------|----------------------------------------------------------------------------------------------------|
| Accuracy                     |                      | 0.1% absolute accuracy over temperature range                                                      |
| Conversion Resolution        | All ranges           | >12 bits                                                                                           |
|                              | Bipolar              | 1 part in 15,000                                                                                   |
|                              | Unipolar             | 1 part in 7,500                                                                                    |
|                              | Unipolar with offset | 1 part in 6,000                                                                                    |
| Linearity Error              |                      | 0.05% of full scale over the operating range                                                       |
| Differential                 | Nonlinearity         | 0.006% of full scale over the operating range                                                      |
|                              | Repeatability        | 0.025% of full scale RMS, constant temperature, no averaging                                       |
| Output Range                 |                      | Four selectable output formats                                                                     |
| Output Averaging             |                      | Options are: N = 8, 16, and 32 samples to be averaged                                              |

# Chapter 10

## B875–200 Configurable A/D Input

---

### Purpose

This chapter describes the functional and physical characteristics of the B875–200 configurable A/D input module.

### What Is in This Chapter?

This chapter contains the following topics:

| Topic                                                             | Page |
|-------------------------------------------------------------------|------|
| B875–200 Configurable A/D Input, Overview                         | 180  |
| B875–200 Configurable A/D Input, Input Pack Insertion             | 182  |
| B875–200 Configurable A/D Input, Module Configuration             | 183  |
| B875–200 Configurable A/D Input, Field Connections                | 186  |
| Module B875–200 Configurable A/D Input, Quick Start Test          | 193  |
| B875–200 Configurable A/D Input, Calibration                      | 197  |
| B875–200 Configurable A/D Input, Available Input Packs            | 200  |
| B875–200 Configurable A/D Input, Input Pack Simplified Schematics | 203  |
| B875–200 Configurable A/D Input, Specifications                   | 208  |
| B875–200 Parameter Configuration                                  | 211  |

## B875–200 Configurable A/D Input, Overview

### General

The B875–200 configurable A/D input module converts a variety of signal sources: thermocouple, RTD, strain gauge/load cell, voltage and current input ranges into binary data. When selected for eight channels, the module is displayed in the I/O map as a B875–200; when selected for four channels, it is displayed in the I/O map as a B873-200.

The module provides the capability to poll a wide array of field devices requiring different signal sources based upon the application selected. Selection may be made from more than 48 available input packs, with any mix per module being acceptable.

**NOTE:** Third-party input packs

Performance is not guaranteed with third-party 5B type packs. When using third-party packs, contact the manufacturer for support.

An eight-position DIP switch is used to select from one to eight input channels per module. In addition, a two-position jumper is used to select either 0, 2, or 4 samples to be averaged per input. Averaging helps reduce the impact of spurious noise on the input.

Some application examples include food processing, press operating, chemical processing, painting, and foundry casting.

The module has four/eight analog inputs and is capable of updates to all eight channels every 4 ms. The 12-bit resolution for all ranges, and the absolute accuracy is dependent on the input pack type. This allows for fast and precise control of the application.

**NOTE:** This module requires two slots.

## Simplified Schematic Diagram

Refer to the following simplified schematic diagram for the module.

## B875–200 Configurable A/D Input, Input Pack Insertion

### Input Pack Insertion Procedure

Use the following procedure to insert the required input pack.

| Step | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Remove channel pull-off tabs that correspond with desired input pack placement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 2    | Insert input packs into right side of module corresponding to desired channels. Align input pack so that Phillips-head screw is on top and 14 leads are at bottom.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 3    | <p>Tighten Phillips-head screw.</p> <p><b>Note:</b> When using either a AS–5B32001A or AS–5B32002A current input pack, a fusible resistor must also be inserted into the board. The proper fusible resistor (part # AS–0418–000) comes with the current input pack.</p> <p><b>Note:</b> Always insert the fusible resistor before inserting the input pack. If the fusible resistor is rectangular, ensure that the side with two leads is next to the input pack.</p> <p><b>Note:</b> Never place the fusible resistor between adjacent channels. This can be detected when the fusible resistor hides the CH on the channel label on the board.</p> |
| 4    | Locate write-on label plate (part # AS–157A–000) shipped with module. Ensure that input pack catalog numbers and input register numbers for each input pack installed are clearly identified on label.                                                                                                                                                                                                                                                                                                                                                                                                                                                |

# B875–200 Configurable A/D Input, Module Configuration

## Setting the DIP Switch

Use the following procedure to set the eight-position DIP switch.

| Step | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Locate eight-position DIP switch on rear of module.<br><b>Note:</b> These DIP switches are used to select the desired number of channels, from 1—8.                                                                                                                                                                                                                                                                                                                       |
| 2    | Set DIP switches based upon intended application prior to installation. Refer to module configuration DIP switch settings diagram, below, and to label located on left side of analog input module.<br><b>Note:</b> The analog input module is shipped with channel 1 ON, B873), DIP switch (SW1) set to ON. The module is I/O mapped as a B873 when <b>only</b> channels 1—4 are in use. The module is I/O mapped as a B875 when <b>more than</b> 4 channels are in use. |
| 3    | Ensure all unused DIP switches are kept to the right.                                                                                                                                                                                                                                                                                                                                                                                                                     |

Configuring Settings

Module configuration DIP switch settings, diagram

**NOTE:** The B873 mode provides a faster throughput. Ensure that the placement of the input packs correspond with the DIP switch settings.

Sample Averaging Selection

Use the following table to determine the sample averaging selection.

| Step | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Locate access hole on left side of module.<br><b>Note:</b> This hole allows access to three leads and a two-position jumper, that selects the number of samples to be averaged per input channel: 0, 2, 4 samples to be averaged.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 2    | Select either 0, 2 or 4 samples to be averaged.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 3    | <p>Set desired averaging prior to installation. Refer to jumper settings diagram, below, and label located on left side of module.</p> <p><b>Note:</b> The module is shipped with the jumper set for four samples. Module configuration DIP switch settings, diagram</p> <p>jumper located below side access hole determines number of samples to average</p> <p>no average</p>  <p>2 samples</p> <p>2 samples</p>  <p>2 samples</p> <p>jumper on one leg only</p>  <p><b>Note:</b> Sample averaging helps reduce the impact of serious noise on the input.</p> |

## B875–200 Configurable A/D Input, Field Connections

### General

The module may be wired to accept the following types of packs: current input type; voltage input type; RTD input type; linear thermocouple input type; strain gauge/load cell input type. These input types and their connections are discussed below. Refer to the diagram showing the typical field circuit connections for current inputs, below.

Typical field circuit connections for current inputs, diagram

**NOTE:** A precision 20  $\Omega$  fusible resistor must be installed in each current input channel. The fusible resistor is supplied with each 4 - 20 mA or 0 - 20 mA input pack. The B875-200 may be installed in either the sinking or sourcing configuration.

Each channel is floating. Should you need a ground, you may tie one side of field wiring to chassis ground or use shield wiring with shield tied to chassis ground. Refer to note

### Low Bandwidth Current Inputs (AS-5B32)

Select the channels to be used for current input packs. Current inputs are selected by inserting the input pack, together with a fusible resistor beside the pack, for the appropriate channel. Refer to the typical field circuit connections for current inputs diagram, above, while connecting the field-side wiring to the proper pins on the field connector.

**NOTE:** All input packs provide 1500 Vac/2500 Vdc isolation from bus to field wiring. Since any floating inputs may be exposed to static charges as high as 15 kV, connect one of the signal input leads to chassis ground either directly or through a resistor in the range of 1kW—10MW. Use the chassis ground at terminals 1, 2, 39 or 40. If the signal source used with an input has a dc signal path to chassis ground, no additional path is required at the B875 end of the field wiring.

**NOTE:** Channels are set independently. Any of the pack types identified above can be intermixed.

### Low and Wide Bandwidths (AS-5B30/31 and AS-5B40/41) Voltage Inputs

Note the channels to receive the voltage inputs. Voltage inputs are selected by inserting the input pack for the appropriate channel. Refer to the following drawing, and connect field-side wiring to the proper pins on the field connector.

Typical field circuit connections for voltage inputs, diagram

**NOTE:** Voltage wide bandwidth input packs are significantly more sensitive to noise on input lines. Low bandwidth packs are recommended for general purpose input voltage usage.

**NOTE:** The shield-type shown is recommended. One side of the signal source may be connected to chassis ground when using twisted pair wiring.

**NOTE:** Channels are set independently. Any mixture of current, voltage, RTD, linear thermocouple, or strain gauge/load cell may be used as inputs.

RTD (AS-5B34) Inputs

Note the channels designated to receive RTD inputs. RTD inputs are selected by inserting the input pack for the appropriate channel. Refer to the diagram below and connect the field-side wiring to the proper pins on the field connector.

Typical field circuit connections for RTD inputs, diagram

**NOTE:** The shield-type shown is recommended. One side of the signal source may be connected to chassis ground when using twisted pair wiring.

**NOTE:** Channels are set independently. Any mixture of current, voltage, RTD, linear thermocouple, or strain gauge/load cell may be used as inputs.

### Linear Thermocouple (AS-5B47)

Note the channels designated to receive linear thermocouple inputs. Linear thermocouple inputs are selected by inserting the input pack for the appropriate channel. Refer to the diagram below and connect the field-side wiring to the proper pins on the field connector.

Typical field circuit connections for linear thermocouple inputs, diagram

**NOTE:** Thermocouple must be of the type designated by the dash number of the AS-5B47 input pack in use. Cold junction compensation is done by a temperature sensor located immediately behind the connector block.

**NOTE:** The shield-type shown is recommended. One side of the signal source may be connected to chassis ground when using twisted pair wiring.

**NOTE:** Channels are set independently. Any mixture of current, voltage, RTD, linear thermocouple, or strain gauge/load cell may be used as inputs.

**Strain Gauge/Load Cell, 0—+5 V Output (AS-5B38)**

Note the channels designated to receive strain gauge/load cell inputs. Strain gauge/load cell inputs are selected by inserting the input pack for the appropriate channel. Refer to the diagram below and connect the field-side wiring to the proper pins on the field connector.

Typical field circuit connections for strain gauge/load cell inputs

**NOTE:** Connection must be such that strain in normal direction of application results in a positive output voltage applied to vin high. Wiring to pins 5 and 6 may be reserved if output negative.

**NOTE:** The shield-type shown is recommended. One side of the signal source may be connected to chassis ground when using twisted pair wiring.

**NOTE:** Channels are set independently. Any mixture of current, voltage, RTD, linear thermocouple, or strain gauge/load cell may be used as inputs.

## Securing the Module

Use the following procedure to secure the module.

| Step | Action                                                                                                                                                                                       |
|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Reinstall any module temporarily removed                                                                                                                                                     |
| 2    | When using key pins (provided with housing shipment), install them above and below housing slot selected.                                                                                    |
| 3    | Carefully insert module into housing firmly, seating edge connector in backplane.                                                                                                            |
| 4    | Secure module to housing using captive slotted mounting screws at top and bottom of module's front panel.                                                                                    |
| 5    | Locate write-on label plate (Part No. AS-157A-000). Write input pack catalog numbers and input register numbers for each installed input pack.                                               |
| 6    | Insert write-on label plate on right side of installed module. Using two standard screws supplied, tighten them into upper and lower portions of housing slot as shown in following diagram. |

## Write-on label placement, diagram

**NOTE:** Ensure that all input packs are removed prior to returning module for repair.

## Module B875–200 Configurable A/D Input, Quick Start Test

### General

Quick start tests for the following modules are described below:

- Isolated Voltage Input (-10 — +10 V)
- Isolated Current Input (4 — 20 mA)
- Isolated Voltage Input (-10 — +10 mV)

**NOTE:** This module has had nyogel grease applied at the factory to the connector pins to ensure good terminal block connections. Do not remove this grease.

### Isolated Voltage Input (-10 — +10 V)

Use the following procedure to configure the module as follows: eight channels (B875 in the I/O map), AS-5B31006A isolated voltage input pack, and four samples to be averaged.

| Step | Action                                                                                                                                                                                                                                                    |
|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Insert eight AS-5B31006A voltage input packs.                                                                                                                                                                                                             |
| 2    | Set all eight-position DIP switches to left (viewed from rear of module when held vertically). This setting selects eight channels.                                                                                                                       |
| 3    | Set two-position jumper so that pins T1, T2, and T3 (located below access hole on left side of module) are not jumpered. This setting selects four average.                                                                                               |
| 4    | Wire + side of field device to input terminal 3 (VIN HIGH).                                                                                                                                                                                               |
| 5    | Wire -side of field device to terminal 4 (VIN LOW) on AS-8535-000 high-density connector.<br><b>Note:</b> Remove keying tabs on AS-8535-000 high density connector prior to installing module.                                                            |
| 6    | Determine which channel and slot locations are to be used.                                                                                                                                                                                                |
| 7    | Stop controller, remove power, and insert module in housing.                                                                                                                                                                                              |
| 8    | Reapply power                                                                                                                                                                                                                                             |
| 9    | I/O map module as a B875, registers 30001—30008 binary.                                                                                                                                                                                                   |
| 10   | Start controller.                                                                                                                                                                                                                                         |
| 11   | Confirm that module's active light is flashing.<br><b>Note:</b> Active ON steady = OK. The active light may also be blinking for one of two reasons: the input to the module is out of range; the selected channel (SW1—SW8) has no input pack installed. |
| 12   | Call up appropriate mapped registers of B875 using programming panel.                                                                                                                                                                                     |
| 13   | Using measurable voltage source of field device, vary input voltage to B875. Compare these values to those in table below.                                                                                                                                |

The following table shows the signal to output value relationship

| Voltage Input (V) | I/O Mapped Registers | Output Value |
|-------------------|----------------------|--------------|
| -9.99             | 30001 =              | 0001         |
| -5.00             | 30001 =              | 1024         |
| 0.00              | 30001 =              | 2048         |
| +5.00             | 30001 =              | 3072         |
| +9.99             | 30001 =              | 4095         |

### Isolated Current Input (-4 — +20 mA)

Use the following procedure to configure the module as follows: eight channels (B875 in the I/O map), AS-5B32001A isolated current input pack, and four samples to be averaged.

| Step | Action                                                                                                                                                                                                                                                                                           |
|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Insert eight fusible resistors shipped with AS-5B32001A input packs.                                                                                                                                                                                                                             |
| 2    | Insert eight current input packs (AS-5B32001A)                                                                                                                                                                                                                                                   |
| 3    | Set all eight-position DIP switches to left (viewed from rear of module when held vertically). This setting selects eight channels.                                                                                                                                                              |
| 4    | Set two-position jumper so that pins T1, T2, and T3 (located below access hole on left side of module) are not jumpered. This setting selects four average.                                                                                                                                      |
| 5    | Wire input terminal 3 (VIN HIGH), 4 (VIN LOW) and 1 (CHASSIS GROUND) on AS-8535-000 high density connector as shown in typical field circuit connections for current inputs diagram, above.<br><b>Note:</b> Remove keying tabs on AS-8535-000 high density connector prior to installing module. |
| 6    | Determine which channel and slot locations are to be used.                                                                                                                                                                                                                                       |
| 7    | Stop controller, remove power, and insert module in housing.                                                                                                                                                                                                                                     |
| 8    | Reapply power                                                                                                                                                                                                                                                                                    |
| 9    | I/O map module as a B875, registers 30001—30008 binary.                                                                                                                                                                                                                                          |
| 10   | Start controller.                                                                                                                                                                                                                                                                                |
| 11   | Confirm that module's active light is flashing.<br><b>Note:</b> Active ON steady = OK. The active light may also be blinking for one of two reasons: the input to the module is out of range; the selected channel (SW1—SW8) has no input pack installed.                                        |
| 12   | Call up appropriate mapped registers of B875 using programming panel.                                                                                                                                                                                                                            |
| 13   | Using measurable voltage source of field device, vary input voltage to B875. Compare these values to those in table below.                                                                                                                                                                       |

The following table shows the signal to output value relationship

| Current Input (mA) | I/O Mapped Registers | Output Value |
|--------------------|----------------------|--------------|
| 4.01               | 30001 =              | 0001         |
| 8.00               | 30001 =              | 1024         |
| 12.00              | 30001 =              | 2048         |
| 16.00              | 30001 =              | 3072         |
| 19.99              | 30001 =              | 4095         |

### Isolated Voltage Input (-10 — +10 mV)

Use the following procedure to configure the module as follows: eight channels (B875 in the I/O map), AS-5B40004A isolated voltage wide bandwidth input pack, and four samples to be averaged.

| Step | Action                                                                                                                                                                                                                                                                                           |
|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Insert eight voltage input packs (AS-5B40004A)                                                                                                                                                                                                                                                   |
| 2    | Set all eight-position DIP switches to left (viewed from rear of module when held vertically). This setting selects eight channels.                                                                                                                                                              |
| 3    | Set two-position jumper so that pins T1, T2, and T3 (located below access hole on left side of module) are not jumpered. This setting selects four average.                                                                                                                                      |
| 4    | Wire input terminal 3 (VIN HIGH), 4 (VIN LOW) and 1 (CHASSIS GROUND) on AS-8535-000 high density connector as shown in typical field circuit connections for current inputs diagram, above.<br><b>Note:</b> Remove keying tabs on AS-8535-000 high density connector prior to installing module. |
| 5    | Wire remaining inputs (2—8) in similar manner, connecting + to VIN HIGH and - to VIN LOW.                                                                                                                                                                                                        |
| 6    | Determine which channel and slot locations are to be used.                                                                                                                                                                                                                                       |
| 7    | Stop controller, remove power, and insert module in housing.                                                                                                                                                                                                                                     |
| 8    | Reapply power                                                                                                                                                                                                                                                                                    |
| 9    | I/O map module as a B875, registers 30001—30008 binary.                                                                                                                                                                                                                                          |
| 10   | Start controller.                                                                                                                                                                                                                                                                                |
| 11   | Confirm that module's active light is flashing.<br><b>Note:</b> Active ON steady = OK. The active light may also be blinking for one of two reasons: the input to the module is out of range; the selected channel (SW1—SW8) has no input pack installed.                                        |
| 12   | Call up appropriate mapped registers of B875 using programming panel.                                                                                                                                                                                                                            |
| 13   | Using measurable voltage source or field device, vary input voltage to B875. Compare these values to those in table below.                                                                                                                                                                       |

The following table shows the signal to output value relationship

| Current Input (mV) | I/O Mapped Registers | Output Value |
|--------------------|----------------------|--------------|
| -9.99              | 30001 =              | 0001         |
| -5.00              | 30001 =              | 1024         |
| 0.00               | 30001 =              | 2048         |
| +5.00              | 30001 =              | 3072         |
| +9.99              | 30001 =              | 4095         |

## B875–200 Configurable A/D Input, Calibration

### General

The analog input module is calibrated at the factory prior to shipment. To ensure the module's accuracy, the trim-pot should be calibrated regularly on a yearly interval.

The following tools and materials are needed to calibrate a configurable A/D input module:

- A precision digital readout voltmeter with an accuracy of 0.0001 V on a 10 V scale.
- A 1/8-inch bit, thin-blade screwdriver.
- A 1/4-inch Phillips-head screwdriver.

**NOTE:** Calibration is not recommended for analog current, low bandwidth, 4—20 mA (AS–5B32001A) type input packs because of their reduced accuracy

Calibration of a given channel involves calibration of all eight channels of this module. There is no provision to calibrate a particular channel. Therefore, calibration can be performed with any one channel with any type of input pack. Calibration does require the calibration signals to pass through an input pack.

**NOTE:** If the particular input pack used in calibration is out of calibration, then all B875 modules calibrated with this input pack will be improperly calibrated.

Location of trim pot, diagram

Use the following procedure to calibrate the module. The input pack used in this procedure is used only as an example. A five-minute warm-up time is recommended prior to calibration.

| Step | Action                                                                                                                                                                                                                                                                                 |
|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | To access both trim pots, remove two screws and label located on front panel of module, as shown on location of trim-pot diagram, above.<br>Note: The top trim-pot adjusts the total magnitude of the range (full scale). The bottom trim-pot adjusts the zero offset scale.           |
| 2    | Open module handle to expose connectors and terminals.                                                                                                                                                                                                                                 |
| 3    | Install an input pack in any channel, and connect an appropriate signal source to that channel. Refer to voltmeter connections diagram, below.                                                                                                                                         |
| 4    | Apply input signal to selected channel which represents zero signal (zero volts when using analog, V input pack, low bandwidth, 0 to +10 V (AS--5B31003A). On programming panel observe input from B875 for selected channel. Adjust zero cal control (R29) as required to read 0000.  |
| 5    | Apply input signal that results in output between 80 to 90% of full scale. Use 9.375 V if calibrating with an analog, V input pack, low bandwidth, 0 to +10 V (AS--5B31003A). Resultant reading should be set for 0F00 Hex, or 3840 decimal with full scale calibration control (R57). |
| 6    | Repeat previous two steps until readings are correct at both zero and near-full-scale points.                                                                                                                                                                                          |
| 7    | After calibration is complete, disconnect voltmeter, return connections to their original state, close module handle, and replace front label that covers trim-pot.                                                                                                                    |

## B875–200 Configurable A/D Input, Available Input Packs

### General

The module accepts up to eight input packs of any mix. Six categories are available

- Voltage, low bandwidth
- Current, low bandwidth
- RTD
- Strain gauge
- Voltage, wide bandwidth
- Linear thermocouple

Refer to the following tables for the desired input range, output range, and part number required for the intended application.

**NOTE:** 5B type third party packs

When using third party packs, contact the manufacturer for support.

**NOTE:** Input packs are issued as revision level A's, denoted by the last item of the part number, for example, (AS–5B30001A). Changes will be noted by higher revision levels.

**NOTE:** The usable output range for all AS–5BXX input packs is 0—+5 V when used with this module.

### Low Bandwidth (4 kHz) Analog Voltage Input Packs

The following table presents the part numbers and input ranges for the available low bandwidth analog voltage input packs.

| Part Number | Input Range  |
|-------------|--------------|
| AS–5B30001A | 0—10 mV      |
| AS–5B30002A | 0—50 mV      |
| AS–5B30003A | 0—100 mV     |
| AS–5B30004A | -10—+10 mV   |
| AS–5B30005A | -50—+50 mV   |
| AS–5B30006A | -100—+100 mV |
| AS–5B31001A | 0—1 V        |
| AS–5B31002A | 0—5 V        |
| AS–5B31003A | 0— +10 V     |
| AS–5B31004A | -1— +1 V     |
| AS–5B31005A | -5— +5 V     |
| AS–5B31006A | -10— +10 V   |

### Low Bandwidth (4 kHz) Analog Current Input Packs

The following table presents the part numbers and input ranges for the available low bandwidth analog current input packs.

| Part Number | Input Range |
|-------------|-------------|
| AS-5B32001A | 4—20 mA     |
| AS-5B32002A | 0—20 mA     |

**NOTE:** Each current input pack (4—20 mA) comes with a fusible resistor that must be inserted in addition to the input pack.

### Low bandwidth (4k Hz) RTD Input Packs

The following table presents the part numbers, types, and input ranges for the available low bandwidth RTD input packs.

| Part Number | Type                   | Input Range                 |
|-------------|------------------------|-----------------------------|
| AS-5B34P01A | 100 $\Omega$ Pt        | -100— +100°C (-148— +212°F) |
| AS-5B34P02A | 100 $\Omega$ Pt        | 0—100°C (32—212°F)          |
| AS-5B34P03A | 100 $\Omega$ Pt        | 0—200°C (32—392°F)          |
| AS-5B34P04A | 100 $\Omega$ Pt        | 0—600°C (32—1112°F)         |
| AS-5B34C01A | 100 $\Omega$ Cu @ 0°C  | 0—120°C (32—248°F)          |
| AS-5B34C02A | 100 $\Omega$ Cu @ 25°C | 0—120°C (32—248°F)          |
| AS-5B34N01A | 120 $\Omega$ Ni        | 0—300°C (32—572°F)          |

### Wide Bandwidth (10 kHz) Strain Gauge/Load Cell Input Packs

The following table presents the part numbers and input ranges for the available wide bandwidth strain gauge/load cell input packs.

| Part Number | Input Range         |
|-------------|---------------------|
| AS-5B38002A | 3 mV/V, Full Bridge |
| AS-5B38004A | 3 mV/V, Half Bridge |
| AS-5B38005A | 2 mV/V, Full Bridge |

**NOTE:** Isolated strain gauge input to 10 kHz bandwidth, all have 10.0 V excitation for bridges with resistance range of 300W to 10kW.

### Wide Bandwidth (10 kHz) Analog Voltage Input Packs

The following table presents the part numbers and input ranges for the available wide bandwidth analog voltage input packs.

| Part Number | Input Range   |
|-------------|---------------|
| AS-5B40001A | 0—10 mV       |
| AS-5B40002A | 0—50 mV       |
| AS-5B40003A | 0—100 mV      |
| AS-5B40004A | -10— +10 mV   |
| AS-5B40005A | -50— +50 mV   |
| AS-5B40006A | -100— +100 mV |
| AS-5B41001A | 0—1 V         |
| AS-5B41002A | 0—5 V         |
| AS-5B41003A | 0—10 V        |
| AS-5B41004A | -1— +1 V      |
| AS-5B41005A | -5— +5 V      |
| AS-5B41006A | -10— +10 V    |

**NOTE:** Wide bandwidth input packs are only used for high-speed applications. They are more susceptible to external noise levels, and require careful routing and shielding of input signal leads.

### Linear Thermocouple Input Packs

The following table presents the part numbers, types, and input ranges for the available linear thermocouple input packs.

| Part Number | Type | Input Range               |
|-------------|------|---------------------------|
| AS-5B47J01A | J    | 0—760°C (32—1400°F)       |
| AS-5B47J02A | J    | -100— +300°C (-148—572°F) |
| AS-5B47J03A | J    | 0—500°C (32—932°F)        |
| AS-5B47K04A | K    | 0—1000°C (32—1832°F)      |
| AS-5B47K05A | K    | 0—500°C (32—932°F)        |
| AS-5B47T06A | T    | -100— +400°C (-148—752°F) |
| AS-5B47T07A | T    | 0—200°C (32—392°F)        |
| AS-5B47E08A | E    | 0—1000°C (32—1832°F)      |
| AS-5B47R09A | R    | 500—1750°C (932—3182°F)   |
| AS-5B47S10A | S    | 500—1750°C (932—3182°F)   |
| AS-5B47B11A | B    | 500—1800°C (932—3272°F)   |

## B875–200 Configurable A/D Input, Input Pack Simplified Schematics

### Typical Analog mV (5B30) Simplified Schematic

Simplified schematic diagrams for all types of input packs are shown below.

The typical analog mV (5B30) schematic diagram is shown below.

### Typical Analog Current (5B32) Simplified Schematic Diagram

The typical analog current (5B32) schematic diagram is shown below.

### Typical RTD (5B34) Simplified Schematic Diagram

The typical RTD (5B34) schematic diagram is shown below.

### Typical Strain gauge/Load Cell (5B38) Simplified Schematic Diagram

The typical strain gauge/load cell (5B38) schematic diagram is shown below.

### Typical Analog Voltage (5B40 and 5B41) Simplified Schematic Diagram

The typical analog voltage (5B40 and 5B41) schematic diagram is shown below.

### Typical Linear Thermocouple (5B47) Simplified Schematic Diagram

The typical linear thermocouple (5B47) schematic diagram is shown below.

# B875–200 Configurable A/D Input, Specifications

## Specification Table

The following tables provides the specifications for the unit.

| B875-200 Specifications                                                                                                                                                                                                          |                                                                                                                             |                                                                                                                                                                     |

# Chapter 11

## J890 and J892 RIO Interface Modules

---

### Purpose

This chapter explains features and operation of the J890 and J892 RIO interface modules.

### What Is in This Chapter?

This chapter contains the following topics:

| Topic                                                  | Page |
|--------------------------------------------------------|------|
| J890 and J892 Overview                                 | 214  |
| J890 and J892 DIP Switch Settings for the Drop Address | 215  |
| J892 DIP Switch Settings for ASCII Devices             | 218  |
| J890 and J892 Indications                              | 221  |
| J890 and J892 Installation and Connection              | 224  |
| J890 and J892 Connectivity on an S908 RIO Network      | 227  |
| J890 and J892 RIO Interface Error Codes                | 229  |
| J892 ASCII Error Codes                                 | 230  |
| J890 and J892 Specifications                           | 231  |

## J890 and J892 Overview

### Module Features

A J890 or J892 module may be used to provide the drop interface between a 984 programmable controller and a remote drop of 800 series I/O on an S908 remote I/O (RIO) network. Both interface modules are available in two models - one with a single F connector for RIO cable connection and one with two F connectors. In addition, the J892 contains two half-duplex ports that will support ASCII input/output devices at the remote drop.

### Module Table

J89x modules

| Part number | RIO cable ports | ASCII ports |
|-------------|-----------------|-------------|
| AS-J890-101 | 1               | 0           |
| AS-J890-102 | 2               | 0           |
| AS-J892-101 | 1               | 2           |
| AS-J892-102 | 2               | 2           |

## J890 and J892 DIP Switch Settings for the Drop Address

### DIP Switch Location

This J890/J892 Interface devices both have a set of DIP switches located on the back of the module. These switches are used to set a unique RIO network address for the remote drop where the interface will reside. The drop address must be set on the Interface module before it is installed in the I/O housing.

### Interface Rear View

Rear view of J890 and J892 interface.

Switch Settings for Drop Address

The drop address DIP switch has eight positions

**NOTE:** If the controller at the head end of the RIO network supports both a local I/O drop and remote I/O, then drop address # 1 is reserved for the local drop and the first remote drop is addressed as drop # 2. If the controller does not support local I/O, the first remote drop is addressed as drop # 1. For a complete list of 984 controllers and their I/O support capabilities, refer to the Remote I/O System Planning and Installation Guide (890 USE 101 00).

Switch positions for drop addressing.

Switch assignment for drop addressing

| Switches          | Functions                                                   |
|-------------------|-------------------------------------------------------------|
| Positions 1 ... 5 | Drop address 1 - 32<br>set in the 1 direction (to the left) |
| Positions 6 ... 8 | not used<br>set in the 0 direction (to the right)           |

## J892 DIP Switch Settings for ASCII Devices

### DIP Switch Location

J892 Interface devices have an additional set of DIP switches located at the back of the module for setting ASCII device addresses and ASCII communication parameters. If you want to support ASCII devices at this drop, the ASCII switch setting must be made before the module is installed in the I/O housing.

### Interface Rear View

Rear view of J892 interface.

## Switch Settings

The drop address DIP switch has eight positions.

Switch positions for ASCII device settings.

Switches 3 ... 6 are used to set ASCII device addresses on the RIO network. The remaining switches are used to specify ASCII communication parameters.

## Switch Settings for ASCII Communication

Switch settings for ASCII communication

| Switches | ASCII Communication Function                                                                                                                       |

## J890 and J892 Indications

### Overview

On the face of both the J890 and J892 RIO interface modules are a set of LEDs that indicate the RIO processing status of the module and one or two BNC cable ports used to connect the drop to the RIO network.

### J890 Front View

AS-J890 front view

The J892 has additional LEDs that indicate the ASCII device processing status at the drop and a pair of 25-pin, D-shell, female ports for connecting ASCII devices at the drop.

**NOTE:** The LED indicators on the front panels also provide diagnostic information. Various flash patterns indicate errors detected in the RIO interface and/or in the ASCII interface.

**J892 Front View**

J892 front view

### J890 and J892 LED Status Indications for RIO Interface

J890 and J892 LED status indications for RIO interface.

| Name           | Color | Indication (when ON)                                      |
|----------------|-------|-----------------------------------------------------------|
| READY          | Green | RIO interface board successfully passed power-up test     |
| COMM ACTIVE    | Green | I/O data being received or sent                           |
| COMM ERROR     | Red   | Communications error between J890 / J892 and 984          |
| OURBUS ERROR   | Red   | Detected communications error between J890 / J892 and I/O |
| CARRIER DETECT | Green | Processor sensed carrier signal                           |

**NOTE:** The COMM ERROR LED for the RIO Interface is ON if only one port on a dual port interface is connected, indicating that no signals are present at the unconnected port. Communications with the 984 are not effected.

### J892 LED Status Indications for ASCII Interface

J892 LED status indications for ASCII interface

| Name            | Color | Indication (when ON)                                        |
|-----------------|-------|-------------------------------------------------------------|
| READY           | Green | ASCII board successfully passed power-up test               |
| COMM ACTIVE     | Green | ASCII data being received or sent                           |
| COMM ERROR      | Red   | Detected communications error between J892 and ASCII device |
| INTERFACE ERROR | Red   | Detected ASCII communications error in the J892             |

**NOTE:** The COMM ERROR LED for the RIO Interface is ON if only one port on a dual port interface is connected, indicating that no signals are present at the unconnected port. Communications with the 984 are not effected.

# J890 and J892 Installation and Connection

## Introduction

After the appropriate switch settings have been made, follow these steps to install the J890/J892 Interface module in a primary (AS-H819-103 or AS-H827-103, AS-H827-107) 800 series I/O housing. The module is 1.5 slots wide.

## Installing the J890/J892 Module

The following table lists the steps for installing the J890/J892 module:

| Step | Action                                                                                                                                                                                                                                            |
|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Turn off the power to the I/O housing.                                                                                                                                                                                                            |
| 2    | If you are installing a J892, make sure that SW7 on the ASCII communications DIP switch pack is set to the 0 position (on-line).                                                                                                                  |
| 3    | Insert the Interface module in slots 2 and 3 of the primary housing (directly to the right of the power supply unit). Press the module firmly to ensure that it is seated properly. Position of a J890 interface module in a primary I/O housing. |
| 4    | Tighten the two captive screws located at the top and bottom of the interface module.                                                                                                                                                             |

## Connecting the J890/J892 to a Drop Cable

The following table lists the steps for connecting the J890/J892 to a drop cable:

| Step | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | I/O drop malfunction<br>Do not disconnect the drop cable while the system is running; disconnecting can cause other I/O drops to malfunction.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 2    | <p><b>a:</b> If the drop cable connection is a F connector nut, install it directly onto an RIO cable port using a 7/16 in open-end wrench-finger tightening is not sufficient (see Figure below (a))</p> <p><b>b:</b> If the drop cable connection is a BNC connector nut, use a Modicon 52-0752-000 F-to-BNC adapter to make the RIO drop connection (see Figure below (b))</p>  <p>Diagram (a) illustrates the connection of a drop cable with an F-connection to a 90° Angle Adapter. | Step | Action                                                                                                                                                                                                                                                                                                             |
|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3    | If you are installing a J892 for ASCII device support, connect the ASCII device cables to the ASCII ports at this time.                                                                                                                                                                                            |
| 4    | Apply power to the I/O housing. The I/O drop is ready for checkout; refer to Appendix B for diagnostic messages provided by the LEDs on the J890/J892 front panels.<br><b>Note: For a complete discussion of planning and installing an RIO drop, refer to the Remote I/O System Planning Guide (GM-0984-RIO).</b> |

## J890 and J892 Connectivity on an S908 RIO Network

### User Connections

Any 984 programmable controller that supports the S908 RIO network can employ 800\_series I/O at any or all of its remote drops, and any remote drop of 800\_series I/O can use a J890 or J892 as the drop interface module.

The J890/J892 Interface modules are compatible with all 800 series I/O modules used in a S908 RIO network and may support up to 1024 input and 1024 output bits in a drop (depending on the capability of the head-end controller).

A J890/J892 Interface is a 1.5 slot module designed to be installed in the two slots immediately to the right of the primary power supply in the primary housing of a drop. The Interface sends data to and receives data from the 800 series I/O via the drop's backplane; it communicates with the RIO processing unit in the controller via the RIO cable system.

In addition to managing the I/O data flow within the drop and over the RIO network, a J890/J892 is also used to define the address of the drop on the RIO network. Each module is equipped with a set of DIP switches with which you can set a unique drop address. The J892 also provides a second set of DIP switches for specifying ASCII device addresses. The locations of the switch packs and their addressing scheme are defined in *P890 and P892 Switch Settings for the Drop Address*, [page 238](#) and *J892 DIP Switch Settings for ASCII Devices*, [page 218](#).

J890/J892 drop and network communications

## J890 and J892 RIO Interface Error Codes

### Introduction

When power is applied to the I/O housing after the J890/J892 interface module has been installed in the drop, the module performs a set of confidence tests on itself. If any faults are detected in the RIO processing portion of the module, the RIO LEDs on the front panel will display a flash pattern of error codes.

### Error Codes

J890/J892 I/O processor board test error codes

| Failed Diagnostic | READY | COMM ACTIVE | COM ERROR | INTERFACE ERROR |
|-------------------|-------|-------------|-----------|-----------------|
| Machine Dead      | OFF   | OFF         | OFF       | OFF             |
| PROM Test         | OFF   | Flashing    | OFF       | OFF             |
| RAM Test          | OFF   | OFF         | Flashing  | OFF             |
| LAN Test          | OFF   | Flashing    | Flashing  | OFF             |
| CPU Test          | OFF   | OFF         | OFF       | Flashing        |
| OBM Test          | OFF   | Flashing    | OFF       | Flashing        |
| Switch Test       | OFF   | OFF         | Flashing  | Flashing        |

The interface error (OBM) test may be caused by an I/O module that has shorted the I/O bus. All of the other diagnostic error codes indicate an internal failure in the remote I/O processing portion of the J890/J892 interface.

# J892 ASCII Error Codes

## Introduction

Confidence tests can also be run on the J892 module to test the ASCII portion of the device. To establish the ASCII confidence test mode on the J892 board, set SW7 to 1 (to the left) on the eight-position DIP switch. This will run the loop test.

## Error Codes

J892 ASCII board test error codes

| Failed Diagnostic | READY    | COMM<br>ACTIVE | COM ERROR | INTERFACE<br>ERROR |
|-------------------|----------|----------------|-----------|--------------------|
| Machine Dead      | OFF      | OFF            | OFF       | OFF                |
| PROM Test         | Flashing | OFF            | OFF       | OFF                |
| RAM Test          | OFF      | Flashing       | OFF       | OFF                |
| HDLC Digital      | Flashing | Flashing       | OFF       | OFF                |
| HDLC Analog       | OFF      | OFF            | Flashing  | OFF                |
| Serial Port Low   | Flashing | OFF            | Flashing  | OFF                |
| Interrupt Low     | OFF      | Flashing       | Flashing  | OFF                |
| Serial Port High  | Flashing | Flashing       | Flashing  | OFF                |
| Interrupt High    | OFF      | OFF            | OFF       | Flashing           |
| Baud Rate Low     | Flashing | OFF            | OFF       | Flashing           |
| Baud Rate High    | OFF      | Flashing       | OFF       | Flashing           |
| Switch Test       | Flashing | Flashing       | OFF       | Flashing           |
| Modem Disconnect  | OFF      | OFF            | Flashing  | Flashing           |
| Modem DSR Error   | Flashing | OFF            | Flashing  | Flashing           |

With the exception of the switch test, these diagnostic error codes indicate an internal failure in the ASCII processing portion of the J892 interface.

## J890 and J892 Specifications

### Introduction

The following tables give specifications for the J890 and J892 modules.

### Customer Part Numbers

Customer part numbers

# Chapter 12

## P890 and P892 RIO Processors

---

**Purpose**

This chapter explains features and operation of the P890 and P892 RIO processors.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                              | Page |
|----------------------------------------------------|------|
| P890 and P892 Overview                             | 234  |
| P890 and P892 Indicators                           | 236  |
| P890 and P892 Power Available                      | 237  |
| P890 and P892 Switch Settings for the Drop Address | 238  |
| P890 and P892 Installation                         | 242  |
| P890 and P892 Specifications                       | 243  |

## P890 and P892 Overview

### General Description

The P890/P892 remote I/O processors provide a direct interface between 984 PLC and 800 series I/O. Both modules include an integrated power supply that supplies 3 amps of power to adjacent 800 series I/O modules. In addition, the P892 processor provides two half duplex ASCII ports.

The P890/P892 processor is mounted directly into a primary 19- or 27-inch 800 series I/O housing (H819/H827-209). The connection between the processor and the I/O modules is made through the housing backplane. The remote I/O system coaxial cabling provides the communications path between the P890/P892 processor and the RIO Head.

The P890/P892 processors are compatible with all programmable controllers that support the S908 remote I/O system. The P890/P892 processors are compatible with all 800 Series I/O modules: discrete, analog, register and intelligent. The actual number of remote I/O drops and I/O points per drop supported depends on the controller size.

The P890/P892 processors support a single remote I/O cable configuration. Cable runs from the 984 controller through taps that have drop cables to the P89X remote interfaces.

The P890/P892 processor power supply supports two separate power sources, 115/230 Vac and 24 Vdc. The AC power source is switch selectable between 115 V and 230 V settings. The top ON/OFF switch controls the AC power and the bottom ON/OFF switch controls the 24 Vdc source. Either source can be used to power the P890/P892. The 24 Vdc can be used as a backup power source to the 115/230 Vac. The single slot P890/P892 can provide a maximum of 3 amps to power 800 series I/O modules. For systems needing more power, expander power supplies should be inserted in the next I/O housing.

Front, bottom and side view

## P890 and P892 Indicators

### Overview

The following table shows P890/P892 processor indicator lights and provides the name, color and indication when on. The I/O processor lights are on both processors. The ASCII error indicator is only on the P892 processor.

### Indicator Lights for P890 and P892

Indicator lights for I/O processor P890 and P892.

| Name         | Color | Indication (when on)                                                                |
|--------------|-------|-------------------------------------------------------------------------------------|
| Power OK     | Green | All Voltages are OK.                                                                |
| Ready        | Amber | I/O processor board successfully passed power-up tests.                             |
| Comm Active  | Green | I/O comm active between P89X and 984.                                               |
| Comm Error   | Red   | A communications error has been detected between the processor and the controller.  |
| Ourbus Error | Red   | A communications error has been detected between the processor and the I/O modules. |

### Indicator Light ASCII (P892 only)

ASCII error indicator light

| Name        | Color | Indication (when on)                                              |
|-------------|-------|-------------------------------------------------------------------|
| ASCII Error | Red   | An ASCII communications error has been detected at the processor. |

## P890 and P892 Power Available

### Overview

Power supplied for I/O use

+5 VIO @ 3 Amp max\*

+4.3 V @ 3 Amp max\*

-5 V @ .25 Amp

\* The +5 VIO and +4.3 V combined total load current should not exceed 3 Amps.

The P890/P892 processors provide a fast drop scan rate, less than 5 milliseconds for 256 I/O points. The communication link time to the RIO head is less than 1 millisecond with up to five immediate retries.

### Typical Configuration

## P890 and P892 Switch Settings for the Drop Address

### Overview

Before installing the P890 or P892 processor, you must set the switches located on the bottom of the unit. The P890/P892 processor has one set of eight switches used to select drop/port address and ASCII communications handshake method.

### P890/P892 Drop Address Switch Settings

View of the switches

Description of the switches

| Switches                 | Functions                                                                                                    |
|--------------------------|--------------------------------------------------------------------------------------------------------------|
| For P890 and P892<br>1-6 | drop/port address 1-32 binary form                                                                           |
| For P890 ONLY<br>7-8     | not used, set to left                                                                                        |
| For P892 ONLY<br>7<br>8  | hand shaking for port 1<br>hand shaking for port 2<br>L = Data Terminal Ready/Data Set Ready<br>R = Xon/Xoff |

**NOTE:** You MUST go into the Traffic Cop software and set the ASCII port number to match your switch selection, noting the drop.

**NOTE:** Drop and port addresses are related. Switch settings for Drop #3 correspond to ASCII ports 5 and 6.

### Drop Address Switch Settings

The drop address is set by the setting switches one through six in the switchpack as shown in the table.

| Switches |   |   |   |   |   |              |                              |
|----------|---|---|---|---|---|--------------|------------------------------|
| 1        | 2 | 3 | 4 | 5 | 6 |              |                              |
|          |   |   |   |   |   | Drop Address | Port Number<br>For P892 ONLY |

| R        | R | L | R | R | L | 28           | N/A                          |
| L        | L | R | R | R | L | 29           | N/A                          |

| Switches |   |   |   |   |   |              |                              |
|----------|---|---|---|---|---|--------------|------------------------------|
| 1        | 2 | 3 | 4 | 5 | 6 |              |                              |
|          |   |   |   |   |   | Drop Address | Port Number<br>For P892 ONLY |
| R        | L | R | R | R | L | 30           | N/A                          |
| L        | R | R | R | R | L | 31           | N/A                          |
| R        | R | R | R | R | L | 32           | N/A                          |

**NOTE:** Drop addresses 1 to 16 can be used as RIO and ASCII. However, drop addresses 17 to 32 can ONLY be used as RIO.

### 9-Pin ASCII Ports

Correct cable configuration is dependent upon the requirements of the unit attached to the ascii port.

| Pin Number | Designation               |
|------------|---------------------------|
| 1          | Chassis Ground (CG)       |
| 2          | Receive (RXD)             |
| 3          | Transmit (TXD)            |
| 4          | Data Terminal Ready (DTR) |
| 5          | Signal Ground (SG)        |
| 6          | Data Set Ready (DSR)      |
| 7          | Request to Send (RTS)     |
| 8          | Clear to Send (CTS)       |
| 9          | No Connection (N.C.)      |

### Sample Pin Layout for a 9-Pin ASCII Port

The following graphic depicts one possible pin layout for a cable connecting a P892 ASCII port and another device using hardwired flow control. Actual pin numbers may vary from device to device.

## P890 and P892 Installation

### Introduction

The following procedure describes how to install a P890 or P892 processor. The processor is installed in an H819/H827-209 800 series I/O Housing in the left-most slot.

**NOTE:** To ensure proper operation of this module, you must have one of the following revisions (or higher) of Traffic Cop software:

P190 AS-T984-302 Version 2.01 Rev.J

IBM AS-DIBM-902 Version 3.01 Rev.X

If you do not have a tape or diskette with one of the above software levels, call Customer Service and obtain the proper software.

### Procedure for Installation

How to Install a P890 or P892 processor

| Step | Action                                                                                                                                                                                                                        |
|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Set the address/handshake switch as shown in <i>P890/P892 Drop Address Switch Settings</i> , <a href="#">page 238</a> .                                                                                                       |
| 2    | Ensure that the power supply switches are OFF and power to the housing is OFF. Also, set the 115/230 VAC switch based upon your power requirement. Do not insert the P890 or P892 processor if power is supplied to the unit. |
| 3    | Remove the plastic cover to connect the power cables, once they are in place replace the plastic cover.                                                                                                                       |
| 4    | Wire up the power cable for either AC (three pin plug) or DC (two pin plug) depending upon the application.                                                                                                                   |
| 5    | Connect remote I/O cable to the P890 or P892 F-connector.                                                                                                                                                                     |
| 6    | Remove the ASCII port connector covers. Connect the ASCII device cable(s). For the P892 only.                                                                                                                                 |
| 7    | Insert the P890/P892 into the H819/H827-209 housing in the left-most slot. Press firmly to ensure that the processor is seated properly in the housing.                                                                       |
| 8    | Tighten the two captive screws located at the top and bottom of the processor.                                                                                                                                                |
| 9    | Turn the power supply on. The I/O drop is ready for checkout.                                                                                                                                                                 |

## P890 and P892 Specifications

### Topology

#### Topology

|           |                                       |
|-----------|---------------------------------------|
| Cabling   | Single coaxial cable 75 ohm RG-6 type |
| Connector | F-Type                                |

### Communications

#### Communications

|                   |                                                              |
|-------------------|--------------------------------------------------------------|
| Rate              | 1.544 MHZ                                                    |
| Drop scan time    | < 5 ms for 256 I/O points                                    |
| Comm link time    | < 1 ms for 256 I/O points                                    |
| Drop hold up time | programmable from 300msec to 6553.6sec (100 msec increments) |

### Power Supplied to I/O

#### Power supplied to I/O

|        |          |
|--------|----------|
| +5 VIO | @3 Amp*  |
| +4.3 V | @3 Amp*  |
| -5 V   | @.25 Amp |

\*The +5 VIO and +4.3 V combined can not exceed 3 Amps.

### Power Requirements

115/230 VAC +/- 15% @ .75 Amps, 47-63 Hz

24 VDC +/- 15% @ 2 Amps Max.

### AC Power Loss Hold up time

8.3 mSec

### RFI

Meets applicable FCC requirements for industrial equipment

## EMI

|                          |              |
|--------------------------|--------------|
| Radiated Susceptibility  | MS 461B RS03 |
| Conducted Susceptibility | MS 461N CS02 |

## Surge Withstand

IEEE 472\_1974, ANSI C37.90a

## Static Discharge

15kv to all exterior surfaces, connectors covered or terminated properly, mounted on grounded panel.

## Environmental Operating Conditions

Environmental operating conditions

## Part III

### 800 Series Discrete I/O Modules

---

#### At a Glance

This part provides a detailed description of the 800 Series discrete I/O modules. It includes technical data and wiring information for each module.

#### What Is in This Part?

This part contains the following chapters:

| Chapter | Chapter Name                                     | Page |
|---------|--------------------------------------------------|------|
| 13      | B802–008 115 Vac Output                          | 247  |
| 14      | B803–008 115 Vac Input                           | 253  |
| 15      | B804–116 115 Vac Output                          | 259  |

# Chapter 13

## B802–008 115 Vac Output

---

**Purpose**

This chapter describes the functional and physical characteristics of the B802–008 115 Vac output module.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                      | Page |
|--------------------------------------------|------|
| B802–008 115 Vac Output, Overview          | 248  |
| B802–008 115 Vac Output, Field Connections | 249  |
| B802–008 48 Vac Output, Specifications     | 250  |
| B802–008 Parameter Configuration           | 251  |

## B802-008 115 Vac Output, Overview

### General Characteristics

The B802-008 115 Vac output module converts logic signals used within the PLC into eight independent 115 Vac outputs. Each output is capable of driving a relay, pilot lamp, motor starter, solenoid, or any other load up to 2.0 A.

The B802-008 is capable of handling a total continuous current of 12 A. The module uses triac switches to control loads connected to an external power source. These switches are designed to withstand the high surge currents typical of industrial loads.

### Simplified Schematic

The module's eight outputs are separated into four groups of two outputs each. An LED indicator lights when an output is on.

Following is a simplified schematic of the B802-008 115 Vac output module.

## B802-008 115 Vac Output, Field Connections

### Overview

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

### Terminal Numbering and Output Connections

The following diagram shows terminal numbering and output connections for the the B802-008 module.

## B802-008 48 Vac Output, Specifications

### Specification Table

The following table provides the specifications for the unit.

| B802-008 Specifications |                    |                                                                          |

# Chapter 14

## B803–008 115 Vac Input

---

**Purpose**

This chapter describes the functional and physical characteristics of the B803–008 115 Vac input module.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                     | Page |
|-------------------------------------------|------|
| B803–008 115 Vac Input, Overview          | 254  |
| B803–008 115 Vac Input, Field Connections | 255  |
| B803–008 115 Vac Input, Specifications    | 256  |
| B803–008 Parameter Configuration          | 257  |

## B803-008 115 Vac Input, Overview

### General Characteristics

The B803-008 115 Vac input module senses and converts switched input signals into logic voltage levels used by the PLC into 8 independent 115 Vac outputs. The module allows for up to eight independently sensed inputs. These inputs can be received from push buttons, limit and proximity switches, as well as other 115 Vac sources.

### Simplified Schematic

Following is a simplified schematic of the B803-008 115 Vac input module.

## B803–008 115 Vac Input, Field Connections

### Overview

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

### Terminal Numbering and Input Connections

The following diagram shows terminal numbering and input connections for the B803–008 module.

## B803–008 115 Vac Input, Specifications

### Specification Table

The following table provides the specifications for the unit.

| B803-008 Specifications |                   |                                                                                           |
|-------------------------|-------------------|-------------------------------------------------------------------------------------------|

# Chapter 15

## B804–116 115 Vac Output

---

**Purpose**

This chapter describes the functional and physical characteristics of the B804–116 115 Vac output module.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                      | Page |
|--------------------------------------------|------|
| B804–116 115 Vac Output, Overview          | 260  |
| B804–116 115 Vac Output, Field Connections | 261  |
| B804–116 48 Vac Output, Specifications     | 262  |
| B804–116 Parameter Configuration           | 263  |

## B804–116 115 Vac Output, Overview

### General Characteristics

The B804–116 115 Vac output module converts logic signals used in the PLC into 16 independent 115 Vac outputs. Each output is capable of driving a relay, pilot lamp, motor starter, solenoid, or any other load up to 2.0 A.

The B804–116 is capable of handling a total continuous current of 6 A/group of eight points and 12 A/module. The module uses triac switches to control loads connected to an external power source. These switches are designed to withstand the high surge currents typical of industrial loads.

### Simplified Schematic

Following is a simplified schematic of the B804–116 115 Vac output module.

The module's 16 outputs are separated into two groups of eight outputs each.

## B804–116 115 Vac Output, Field Connections

### Overview

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

### Terminal Numbering and Output Connections

The following diagram shows terminal numbering and output connections for the the B804-116 module.

## B804–116 48 Vac Output, Specifications

### Specification Table

The following table provides the specifications for the unit.

| B804-116 Specifications |                      |                                                                           |

# Chapter 16

## B804–148 48 Vac Output

---

**Purpose**

This chapter describes the functional and physical characteristics of the B804–148 48 Vac output module.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                     | Page |
|-------------------------------------------|------|
| B804–148 48 Vac Output, Overview          | 266  |
| B804–148 48 Vac Output, Field Connections | 267  |
| B804–148 48 Vac Output, Specifications    | 268  |
| B804–148 Parameter Configuration          | 269  |

## B804-148 48 Vac Output, Overview

### General Characteristics

The B804-148 48 Vac output module converts logic signals used within the PLC into 16 independent 48 Vac outputs. Each output is capable of driving a relay, pilot lamp, motor starter, solenoid, or any other load up to 2.0 A. The module has 16 outputs, divided into two groups of eight discrete points.

### Simplified Schematic

Following is a simplified schematic of the B804-148 48 Vac output module.

## B804-148 48 Vac Output, Field Connections

### Overview

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

### Terminal Numbering and Output Connections

The following diagram shows terminal numbering and output connections for the the B804-148 module.

## B804-148 48 Vac Output, Specifications

### Specification Table

The following table provides the specifications for the unit.

| B804-148 Specifications |                |                                                                           |

# Chapter 17

## B805–016 115 Vac Input

---

**Purpose**

This chapter describes the functional and physical characteristics of the B805–016 115 Vac input module.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                     | Page |
|-------------------------------------------|------|
| B805–016 115 Vac Input, Overview          | 272  |
| B805–016 115 Vac Input, Field Connections | 273  |
| B805–016 115 Vac Input, Specifications    | 274  |
| B805–016 Parameter Configuration          | 275  |

## B805-016 115 Vac Input, Overview

### General Characteristics

The B805-016 115 Vac input module senses and converts switched input signals into logic voltage levels used by the PLC. The module allows for up to 16 inputs in 2 groups of 8. These inputs can be received from push buttons, limit and proximity switches, as well as other 115 Vac sources.

### Simplified Schematic

Following is a simplified schematic of the B805-016 115 Vac input module.

## B805–016 115 Vac Input, Field Connections

### Overview

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

### Terminal Numbering and Input Connections

The following diagram shows terminal numbering and input connections for the B805–016 module.

## B805–016 115 Vac Input, Specifications

### Specification Table

The following table provides the specifications for the unit.

| B805–016 Specifications |                                             |                                                                     |

# Chapter 18

## B806–032 115 Vac Output

---

**Purpose**

This chapter describes the functional and physical characteristics of the B806–032 115 Vac output module.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                      | Page |
|--------------------------------------------|------|
| B806–032 115 Vac Output, Overview          | 278  |
| B806–032 115 Vac Output, Field Connections | 280  |
| B806–032 115 Vac Output, Fusing Guidelines | 281  |
| B806–032 115 Vac Output, Specifications    | 282  |
| B806–032 Parameter Configuration           | 283  |

## B806–032 115 Vac Output, Overview

### General Characteristics

The B806–032 115 Vac output module has 32 outputs. The outputs can serve 120 Vac voltage relays, motor starters, solenoids, pilot lamps, valves, and other loads rated up to 1.0 A. The outputs are divided into two groups of 16 discrete points.

## Simplified Schematic

Following is a simplified schematic of the B806-032 115 Vac output module.

## B806-032 115 Vac Output, Field Connections

### Overview

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

### Terminal Numbering and Output Connections

The following diagram shows terminal numbering and output connections for the the B806-032 module.

## B806–032 115 Vac Output, Fusing Guidelines

### Fuse Ratings

For reasons of safety and equipment performance, Schneider Electric recommends external fusing on each individual output point according to the following rating:

| Fuse Rating      | Fuse Value | Example Type    |
|------------------|------------|-----------------|
| Very Fast Acting | 2 A        | Littelfuse 3 AB |

**NOTE:** A minimum voltage rating of 250 V is required for fuse operation. Voltage ratings can be found along with current ratings on the fuse end cap.

**NOTE:** Observe fusing guidelines

Failure either to fuse these output modules or to follow the recommended fuse ratings could cause unpredictable results in module performance.

## B806-032 115 Vac Output, Specifications

### Specification Table

The following table provides the specifications for the unit.

| B806-032 Specifications |                      |                                                                            |

# Chapter 19

## B806–124 24 Vac Output

---

### Purpose

This chapter describes the functional and physical characteristics of the B806–124 24 Vac output module.

### What Is in This Chapter?

This chapter contains the following topics:

| Topic                                     | Page |
|-------------------------------------------|------|
| B806–124 24 Vac Output, Overview          | 286  |
| B806–124 24 Vac Output, Field Connections | 288  |
| B806–124 24 Vac Output, Specifications    | 289  |
| B806–124 Parameter Configuration          | 290  |

## B806–124 24 Vac Output, Overview

### General Characteristics

The B806–124 output module has 32 outputs. The outputs can serve 24 Vac voltage relays, motor starters, solenoids, pilot lamps, valves, and other loads rated up to 1.0 A. The outputs are divided into two groups of 16 discrete points.

## Simplified Schematic

Following is a simplified schematic of the B806-124 24 Vac output module.

# B806-124 24 Vac Output, Field Connections

## Overview

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

## Terminal Numbering and Output Connections

The following diagram shows terminal numbering and output connections for the the B806-124 module.

## B806-124 24 Vac Output, Specifications

### Specification Table

The following table provides the specifications for the unit.

| B806-124 Specifications |                      |                                                                            |
|-------------------------|----------------------|----------------------------------------------------------------------------|
| Description             |                      | 24 Vac Output                                                              |
| Number of Points        |                      | 32                                                                         |

# Chapter 20

## B807–132 115 Vac Input

---

**Purpose**

This chapter describes the functional and physical characteristics of the B807–132 115 Vac input module.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                     | Page |
|-------------------------------------------|------|
| B807–132 115 Vac Input, Overview          | 292  |
| B807–132 115 Vac Input, Field Connections | 293  |
| B807–132 115 Vac Input, Specifications    | 295  |
| B807–132 Parameter Configuration          | 296  |

## B807-132 115 Vac Input, Overview

### General Characteristics

The B807-132 115 Vac input module senses and converts switched input signals into logic voltage levels used by the PLC. These inputs can be received from push buttons, limit and proximity switches, as well as other 115 Vac sources.

### Simplified Schematic

Following is a simplified schematic of the B807-132 115 Vac input module.

**NOTE:** When using Binary and BCD inputs remember that input 1 is the MSB and input 32 is the LSB.

## B807-132 115 Vac Input, Field Connections

### Overview

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

### Terminal Numbering and Input Connections

The following diagram shows terminal numbering and input connections for the B807-132 module.

**NOTE:** Pins 1, 20, 21, and 40 have no internal connections.

**NOTE:** The module can operate from 47—63 Hz. However, its use with proximity switches is recommended only at 60 Hz nominal line frequency. Leakage current through switching devices connected to the module may cause a false on condition.

Input Current-to-Frequency Relationship

The following illustration is a plot of the input current versus frequency.

- A. MAXIMUM ALLOWABLE SINEWAVE LEAKAGE CURRENT (FROM EXTERNAL DEVICE)  
TO GUARANTEE AN OFF CONDITION (CALCULATED AT 35 Vac) AT B807 TERMINALS
- B. MINIMUM REQUIRED INPUT CURRENT TO GUARANTEE AN ON CONDITION NOTE: THE MODULE IS INTENDED TO BE USED WITH VOLTAGE INPUTS; VOLTAGE INPUTS GREATER THAN 80Vac RMS AT MODULE TERMINALS GUARANTEE AN ON CONDITION
- C. MAXIMUM MODULE INPUT CURRENT AT 130 Vac

## B807-132 115 Vac Input, Specifications

### Specification Table

The following table provides the specifications for the unit.

| B807-132 Specifications                    |                                                                          |       |
|--------------------------------------------|--------------------------------------------------------------------------|-------|
| Description                                | 115 Vac Input                                                            |       |
| Number of Points                           | 32                                                                       |       |

# Chapter 21

## B808–016 230 Vac Output

---

**Purpose**

This chapter describes the functional and physical characteristics of the B808–016 230 Vac output module.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                      | Page |
|--------------------------------------------|------|
| B808–016 230 Vac Output, Overview          | 298  |
| B808–016 230 Vac Output, Field Connections | 299  |
| B808–016 230 Vac Output, Specifications    | 300  |
| B808–016 Parameter Configuration           | 301  |

## B808-016 230 Vac Output, Overview

### General Characteristics

The B808-016 230 Vac output module converts logic signals used within the PLC into 16 independent 230 Vac outputs. Each output is capable of driving a relay, pilot lamp, motor starter, solenoid, or any other load up to 2.0 A. The B808 is capable of 6 A per group of eight and handling 12 A per module.

The module uses triac switches to control loads connected to an external power source. These switches are designed to withstand the high surge currents typical of industrial loads.

### Simplified Schematic

Following is a simplified schematic of the B808-016 230 Vac output module.

## B808-016 230 Vac Output, Field Connections

### Overview

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

### Terminal Numbering and Output Connections

The following diagram shows terminal numbering and output connections for the the B808-016 module.

## B808–016 230 Vac Output, Specifications

### Specification Table

The following table provides the specifications for the unit.

| B808–016 Specifications |                 |                                                                           |
|-------------------------|-----------------|---------------------------------------------------------------------------|
| Description             |                 | 230 Vac Output                                                            |

# Chapter 22

## B809–016 230 Vac Input

---

**Purpose**

This chapter describes the functional and physical characteristics of the B809–016 230 Vac input module.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                     | Page |
|-------------------------------------------|------|
| B809–016 230 Vac Input, Overview          | 304  |
| B809–016 230 Vac Input, Field Connections | 305  |
| B809–016 230 Vac Input, Specifications    | 306  |
| B809–016 Parameter Configuration          | 307  |

## B809-016 230 Vac Input, Overview

### General Characteristics

The B809-016 230 Vac input module senses and converts switched input signals into logic voltage levels used by the PLC. The module allows for up to 16 inputs in two groups of eight. These inputs can be received from push buttons, limit and proximity switches, as well as other 230 Vac sources.

### Simplified Schematic

Following is a simplified schematic of the B809-016 230 Vac input module.

## B809-016 230 Vac Input, Field Connections

### Overview

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

### Terminal Numbering and Input Connections

The following diagram shows terminal numbering and input connections for the B809-016 module.

## B809-016 230 Vac Input, Specifications

### Specification Table

The following table provides the specifications for the unit.

| B809-016 Specifications                        |                |                                                                         |

# Chapter 23

## B810–008 115 Vac Isolated Output

---

**Purpose**

This chapter describes the functional and physical characteristics of the B810–008 115 Vac output module.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                            | Page |
|--------------------------------------------------|------|
| B810–008 115 Vac Output, Overview                | 310  |
| B810–008 115 Vac Output, Field Connections       | 311  |
| B810–008 115 Vac Isolated Output, Specifications | 312  |
| B810–008 Parameter Configuration                 | 313  |

## B810-008 115 Vac Output, Overview

### General Characteristics

The B810-008 115 Vac output module converts logic signals used within the PLC into eight independent 115 Vac outputs. Each output is capable of driving a relay, pilot lamp, motor starter, solenoid, or any other load up to 2.0 A. The B810-008 is capable of 6 A/group of eight and handling 12 A/module. The module uses eight triac switches to control loads connected to an external power source. These switches are designed to withstand the high surge currents typical of industrial loads.

### Simplified Schematic

Following is a simplified schematic of the B810-008 115 Vac output module.

Zero-cross threshold switching is incorporated into each output circuit. Upon controller command, outputs switch on at the first line voltage zero-crossing, and switch off at the first load current zero-crossing.

Output status indicators are provided for each output circuit. These neon indicators will be on when a load is connected and the output is on, or when there is no connected load. These indicators are isolated from the triac output and require a separate lamp supply which is fused at 1/4 A. Blown fuse indicators are also provided for each output circuit. These indicators light (on) when the corresponding fuse has blown.

## B810-008 115 Vac Output, Field Connections

### Overview

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

### Terminal Numbering and Output Connections

The following diagram shows terminal numbering and output connections for the B810-008 module.

## B810-008 115 Vac Isolated Output, Specifications

### Specification Table

The following table provides the specifications for the unit.

| B810-008 Specifications |                      |                                                                          |

# Chapter 24

## B814–108 Relay Output

---

**Purpose**

This chapter describes the functional and physical characteristics of the B814–108 relay output module.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                    | Page |
|------------------------------------------|------|
| B814–108 Relay Output, Overview          | 316  |
| B814–108 Relay Output, Configuration     | 317  |
| B814–108 Relay Output, Field Connections | 318  |
| 814–108 Relay Output, Specifications     | 319  |
| B814–108 Parameter Configuration         | 320  |

## B814–108 Relay Output, Overview

### General Characteristics

The B814–108 relay output module converts signals from the PLC to eight independent relay outputs. Each output is capable of driving a relay, pilot lamp, motor starter, solenoid, or any other load up to 5.0 A. Each of the eight outputs is electrically isolated from the I/O bus and from the other seven outputs by the relay coil. The module is designed to withstand the high surge currents typical of industrial loads.

The module is user-configurable as to setting for normally-open or normally-closed operation of the relays as described below, and is compatible with other input modules. Assuming a normally-open configuration, when the relay coil is energized, the relay contacts will conduct current from output A terminal to output B terminal (see the following figure).

### Simplified Schematic

Following is a simplified schematic of the B814–108 relay output module.

## B814–108 Relay Output, Configuration

### Configuration Overview

The B814 is initially shipped with all eight channels jumpered for the normally-open configuration. You may optionally wire any of the channels for normally-closed operation if desired. This is done by transferring a wire jumper from one tab to another on the printed circuit board. Refer to the label on the side of the module.

The following table shows the user configuration wire/tab designations for the unit.

| Channel | N.O.  | N.C.  | Channel | N.O.   | N.C.   |
|---------|-------|-------|---------|--------|--------|
| 1       | W1-E2 | W1-E1 | 5       | W5-E10 | W5-E9  |
| 2       | W2-E4 | W2-E3 | 6       | W6-E12 | W6-E11 |
| 3       | W3-E6 | W3-E5 | 7       | W7-E14 | W7-E13 |
| 4       | W4-E8 | W4-E7 | 8       | W8-E16 | W8-E15 |

## B814–108 Relay Output, Field Connections

### Overview

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

### Terminal Numbering and Output Connections

The following diagram shows typical circuit connections for power applications of the B814–108 module.

**NOTE:** Since each output is isolated from the remaining outputs, separate power sources can be used for each load. Each output can be wired for current source or current sink operations.

**NOTE:** It is possible to have the Active indicator lit with one or more output channels working improperly.

## 814–108 Relay Output, Specifications

### Specification Table

The following table provides the specifications for the unit.

| 814–108 Specifications |                       |                                                                          |

# Chapter 26

## B817–116 and B817–216 115/230 Vac Isolated Input

---

### Purpose

This chapter describes the functional and physical characteristics of the B817–116 and B817–216 115/230 Vac isolated input modules.

### What Is in This Chapter?

This chapter contains the following topics:

| Topic                                                                       | Page |
|-----------------------------------------------------------------------------|------|
| B817–116 (115 Vac) and B817–216 (230 Vac) Isolated Input, Overview          | 324  |
| B817–116 (115 Vac) and B817–216 (230 Vac) Isolated Input, Field Connections | 325  |
| B817–116 (115 Vac) and B817–216 (230 Vac) Isolated Input, Specifications    | 328  |
| B817–116 and B817–216 Parameter Configuration                               | 329  |

## B817-116 (115 Vac) and B817-216 (230 Vac) Isolated Input, Overview

### General Characteristics

The B817-116 (115 Vac) and B817-216 (230 Vac) isolated input modules sense off and on input voltages from its field circuitry, converting them to dc logic levels used in the logic program by a PLC.

The module's 16 input circuits are individually isolated from one another. As each input circuit uses a neutral return wire, none has a definite relationship to system ground unless established in the user's field circuitry. The module's logic circuitry is shielded from radiated signals or interference originating in the field, and its field inputs are optically isolated from the system logic.

### Simplified Schematic

Following is a simplified schematic of the B817-116 (115 Vac) and B817-216 (230 Vac) isolated input modules.

When the voltage exceeds the threshold circuits voltage requirement, current will flow through the threshold switch and opto-isolator via the precision attenuator and the bridge rectifier. The output pulses coupled through the isolator are averaged so that a steady state dc voltage representation of the inner circuit's on-state condition is sensed by the Ourbus chip (OBS) on the logic side of the module.

The Ourbus output register is set to represent the field on state. As long as the field input status remains true, the module will communicate this status each time it is polled by the PLC.

## B817–116 (115 Vac) and B817–216 (230 Vac) Isolated Input, Field Connections

### Overview

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

Terminal Numbering and Input Connections

The following diagram shows terminal numbering and input connections for the B817-116 (115 Vac) and B817-216 (230 Vac) isolated input modules.

The following figure shows typical circuitry connected to the user side of the B817-116 field connector.

The following figure shows typical circuitry connected to the user side of the B817-216 field connector.

## B817-116 (115 Vac) and B817-216 (230 Vac) Isolated Input, Specifications

### Specification Table

The following table provides the specifications for the unit.

| B817-x16 Specifications |            |                                                                         |
|-------------------------|------------|-------------------------------------------------------------------------|
| Description             |            | 115 Vac isolated input (B817-116)                                       |
|                         |            | 230 Vac isolated input (B817-216)                                       |

# Chapter 27

## B818 24 Vac Output

---

**Purpose**

This chapter describes the functional and physical characteristics of the B818 24 Vac output module.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                          | Page |
|------------------------------------------------|------|
| B818 24 Vdc (True High) Output, Specifications | 332  |
| B818 24 Vdc Output, Field Connections          | 333  |
| B818—Setting Module DIP Switch                 | 334  |
| B818 Parameter Configuration                   | 335  |

B818 24 Vdc (True High) Output, Specifications

Specification Table

The following table provides the specifications for the unit.

| B818 Specifications |                |                |
|---------------------|----------------|----------------|
| Description         |                | 24 Vdc output  |
| Type of Operation   |                | True high      |
| Number of Points    |                | 32             |
| Operating Voltage   |                | 20—28 Vdc      |
| Number of Groups    |                | 4              |
| Outputs/group       |                | 8              |
| On Current          | Maximum/point  | 1 A continuous |
|                     | Maximum/module | 24 A           |
|                     | Maximum/group  | 6 A            |
|                     | ON→OFF         | 1 ms)          |
| Power Required      | +5 V           | 300 mA         |
|                     | +4.3 V         | 10 mA          |
|                     | -5 V           | 0 mA           |

## B818 24 Vdc Output, Field Connections

### Terminal Numbering and Output Functions

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

The following illustration shows how to field connect the unit.

## B818—Setting Module DIP Switch

### Switch location and position

The four position DIP-switch is located on the rear of the module. This switch controls the mode of the module as Bi-directional or Uni-directional.

### Switch Settings

The following figure presents DIP switch settings for the B872-100 module. Also, refer to the label located on the left side of the module itself.

4- position DIP switches

**NOTE:** Two types of switches may be in use. Toggle up/down or throw left/right

# Chapter 28

## B819–232 230 Vac Input

---

**Purpose**

This chapter describes the functional and physical characteristics of the B819-232 230 Vac input module.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                      | Page |
|--------------------------------------------|------|
| B819-232, 230 Vac Input, Keying and Wiring | 338  |
| B819-232, 32 Point Input, Specifications   | 340  |
| B819-232 Parameter Configuration           | 341  |

## B819-232, 230 Vac Input, Keying and Wiring

### Overview

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

### Terminal Numbering and Output Connections

The following diagram shows terminal numbering and output connections for the the B819-232 module.

|            |    |    |                   |

# Chapter 29

## B820-008 10—60 Vdc Output

---

**Purpose**

This chapter describes the functional and physical characteristics of the B820-008 10—60 Vdc output module.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                        | Page |
|----------------------------------------------|------|
| B820-008 10—60 Vdc Output, Overview          | 344  |
| B820-008 10—60 Vdc Output, Field Connections | 345  |
| B820-008 10—60 Vdc Output, Specifications    | 346  |
| B820-008 Parameter Configuration             | 347  |

## B820-008 10—60 Vdc Output, Overview

### General Characteristics

The B820-008 10—60 output module converts logic signals used within the PLC into eight independent 10—60 Vdc outputs. Each output is capable of driving a relay, pilot lamp, motor starter, solenoid, or any other load up to 2.0 A.

The B820-008 is capable of handling a total continuous current of 12 A. The module uses transistor switches to control loads connected to an external power source. These switches are designed to withstand the high surge currents typical of industrial loads.

### Simplified Schematic

Following is a simplified schematic of the B820-008 10—60 Vdc output module.

The module's eight outputs are separated into four groups of two outputs each.

## B820-008 10—60 Vdc Output, Field Connections

### Overview

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

### Terminal Numbering and Output Connections

The following diagram shows terminal numbering and output connections for the B820-008 module.

## B820-008 10—60 Vdc Output, Specifications

### Specification Table

The following table provides the specifications for the unit.

| B820-008 Specifications |                 |                                                                          |
|-------------------------|-----------------|--------------------------------------------------------------------------|
| Description             |                 | 10—60 Vdc output                                                         |

# Chapter 30

## B821–108 10—60 Vdc Input (True High)

---

**Purpose**

This chapter describes the functional and physical characteristics of the B821–108 10—60 Vdc input module (True High).

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                                   | Page |
|---------------------------------------------------------|------|
| B821–108 10—60 Vdc Input (True High), Overview          | 350  |
| B821–108 10—60 Vdc Input (True High), Field Connections | 351  |
| B821–108 10—60 Vdc Input (True High), Specifications    | 352  |
| B821–108 Parameter Configuration                        | 354  |

## B821-108 10—60 Vdc Input (True High), Overview

### General Characteristics

The B821-108 10—60 Vdc input module (True High) senses and converts switched input signals into logic voltage levels used by the PLC. The module allows for up to eight inputs in four groups of two. Each group shares a common reference voltage supply input. These inputs can be received from push buttons, limit and proximity switches, as well as other 10—60 Vdc sources.

### Simplified Schematic

Following is a simplified schematic of the B821-108 10—60 Vdc input module (True High).

## B821-108 10—60 Vdc Input (True High), Field Connections

### Overview

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

### Terminal Numbering and Input Connections

The following diagram shows terminal numbering and input connections for the B821-108 module.

B821-108 10-60 Vdc Input (True High), Specifications

Specification Table

The following table provides the specifications for the unit.

| B821-108 Specifications |               |                                                                                                                                                                                                                                                                                                                                                                                      |

| Type of Operation       |               | True high                                                                                                                                                                                                                                                                                                                                                                            |
| Number of Points        |               | 8                                                                                                                                                                                                                                                                                                                                                                                    |
| Operating Voltage       |               | 10—60 Vdc                                                                                                                                                                                                                                                                                                                                                                            |
| Number of Groups        |               | 4                                                                                                                                                                                                                                                                                                                                                                                    |
| Inputs/group            |               | 2                                                                                                                                                                                                                                                                                                                                                                                    |
| On Level                | Input Voltage | If the applied input voltage is $\geq 70\%$ of the external power supply, the input to the controller is guaranteed to be in an ON logic state. However, to achieve satisfactory margin, the input voltage should be 75% of the supply voltage. Once the input to the controller is in the ON state, it remains ON as long as the input voltage is $\geq 60\%$ of the power voltage. |

**NOTE:** When designing or selecting a drive circuit for the B821-108 module, take into consideration the values listed for input currents that follow.

Specification Table, Continued

The specification table for the unit is continued below.

| Input Current | Supply Volt (Vdc) | Input Volt (Vdc)                                                                                                                                                                                                                                  | Max Input Current (mA) |
|---------------|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------|
|               | 10                | 10                                                                                                                                                                                                                                                | 10                     |
|               | 24                | 24                                                                                                                                                                                                                                                | 15                     |
|               | 48                | 48                                                                                                                                                                                                                                                | 25                     |
|               | 60                | 60                                                                                                                                                                                                                                                | 32                     |
| OFF Level     | Input Voltage     | If the applied input voltage is $\leq 40\%$ of the supply voltage, the input to the controller is guaranteed to be in an OFF logic state. However, to achieve satisfactory margin, the input voltage should be $\leq 25\%$ of the supply voltage. |                        |

**NOTE:** When designing or selecting a drive circuit for the B821, take into consideration the values listed for source resistances that follow.

### Specification Table, Continued

The specification table for the unit is continued below.

| Source Resistance             | Supply Volt (Vdc) | Input Volt (Vdc)                                                       | Max Source Resistance $\Omega$ |
|-------------------------------|-------------------|------------------------------------------------------------------------|--------------------------------|

# Chapter 31

## B824–016 24 Vdc Output (True High)

---

**Purpose**

This chapter describes the functional and physical characteristics of the B824–016 24 Vdc (True High) output module.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                                 | Page |
|-------------------------------------------------------|------|
| B824–016 24 Vdc Output (True High), Overview          | 356  |
| B824–016 24 Vdc Output (True High), Field Connections | 357  |
| B824–016 24 Vdc Output (True High), Specifications    | 358  |
| B824–016 Parameter Configuration                      | 359  |

## B824-016 24 Vdc Output (True High), Overview

### General Characteristics

The B824-016 24 Vdc (True High) output module consists of sixteen independent outputs divided into two groups of eight. The B824-016 converts signals used within the PLC into 16 independent outputs. Outputs are capable of driving motor starters, relays, and a variety of other loads.

There are 16 transistor switches which are used to control loads connected to external power source. The module's 16 outputs are in two groups, eight outputs per group. Each group is fused to protect the outputs from overload currents and polarity reversal.

### Simplified Schematic

Following is a simplified schematic of the B824-016 24 Vdc (True High) output module.

## B824-016 24 Vdc Output (True High), Field Connections

### Overview

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

### Terminal Numbering and Output Connections

The following diagram shows terminal numbering and output connections for the B824-016 module.

## B824-016 24 Vdc Output (True High), Specifications

### Specification Table

The following table provides the specifications for the unit.

| B824-016 Specifications |                 |                                                                           |
|-------------------------|-----------------|---------------------------------------------------------------------------|
| Description             |                 | 24 Vdc output                                                             |
| Type of Operation       |                 | True high                                                                 |
| Number of Points        |                 | 16                                                                        |
| Operating Voltage       |                 | 20—28 Vdc                                                                 |

# Chapter 32

## B825–016 24 Vdc Input (True High)

---

**Purpose**

This chapter describes the functional and physical characteristics of the B825–016 24 Vdc (True High) input module.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                                | Page |
|------------------------------------------------------|------|
| B825–016 24 Vdc Input (True High), Overview          | 362  |
| B825–016 24 Vdc Input (True High), Field Connections | 363  |
| B825–016 24 Vdc Input (True High), Specifications    | 364  |
| B825–016 Parameter Configuration                     | 365  |

## B825-016 24 Vdc Input (True High), Overview

### General Characteristics

The B825-016 24 Vdc (True High) input module consists of a single group of 16 independent inputs. The B825-016 senses and converts switched input signals into logic voltage levels used by the PLC.

The module provides 16 inputs that share an external power supply. Inputs can be received from push buttons, limit and proximity switches, and other 24 Vdc sources. Input voltages are sensed by comparing the incoming voltage against a fixed threshold. The threshold is a function of the user-supplied field voltage.

### Simplified Schematic

Following is a simplified schematic of the B825-016 24 Vdc (True High) input module.

## B825-016 24 Vdc Input (True High), Field Connections

### Overview

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

### Terminal Numbering and Input Connections

The following diagram shows terminal numbering and input connections for the B825-016 module.

## B825-016 24 Vdc Input (True High), Specifications

### Specification Table

The following table provides the specifications for the unit.

| B825-016 Specifications |            |                                                                                                                    |

# Chapter 34

## B827–032 24 Vdc Input (True High)

---

**Purpose**

This chapter describes the functional and physical characteristics of the B827–032 24 Vdc (True High) input module.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                                | Page |
|------------------------------------------------------|------|
| B827–032 24 Vdc Input (True High), Overview          | 370  |
| B827–032 24 Vdc Input (True High), Field Connections | 372  |
| B827–032 24 Vdc Input (True High), Specifications    | 373  |
| B827–032 Parameter Configuration                     | 374  |

## B827-032 24 Vdc Input (True High), Overview

### General Characteristics

The B827-032 24 Vdc true high input module consists of a single group of 32 independent inputs. The B827 senses and converts switched input signals into logic voltage levels used by the PLC. Inputs can be received from push buttons, limit and proximity switches, and other 24 Vdc sources.

The B827-032 provides 32 inputs that share an external supply voltage. Input voltages are sensed by comparing the incoming voltage against a fixed threshold. The threshold is a function of the user-supplied field voltage.

### Simplified Schematic

Following is a simplified schematic of the B827-032 24 Vdc (True High) input module.

## B827-032 24 Vdc Input (True High), Field Connections

### Overview

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

### Terminal Numbering and Input Connections

The following diagram shows terminal numbering and input connections for the B827-032 module.

## B827-032 24 Vdc Input (True High), Specifications

### Specification Table

The following table provides the specifications for the unit.

| B827-032 Specifications |                |                                                                          |
|-------------------------|----------------|--------------------------------------------------------------------------|
| Description             |                | 24 Vdc high density input                                                |
| Type of Operation       |                | True high                                                                |
| Number of Points        |                | 32                                                                       |
| Operating Voltage       |                | 18—30 Vdc                                                                |
| Number of Groups        |                | 1                                                                        |
| Outputs/group           |                | 32                                                                       |
| ON Level Input Voltage  |                | $\geq 22.5$ Vdc or .75 of Vs, whichever is less                          |
| OFF Level Input Voltage |                | $\leq 4.5$ Vdc or .25 of Vs, whichever is greater                        |
| Input Resistance        | On State       | 8—11 k $\Omega$                                                          |
|                         | Off State      | 6—8 k $\Omega$                                                           |
| Maximum Response Time   | OFF→ON         | 0.4 ms                                                                   |
|                         | ON→OFF         | 1 ms)                                                                    |
| Power Required          | +5 V           | 30 mA                                                                    |

# Chapter 35

## B828–016 5 V TTL Output

---

**Purpose**

This chapter describes the functional and physical characteristics of the B828–016 5 V TTL output module.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                      | Page |
|--------------------------------------------|------|
| B828–016 5 V TTL Output, Overview          | 376  |
| B828–016 5 V TTL Output, Field Connections | 377  |
| B828–016 5 V TTL Output, Specifications    | 378  |
| B828–016 Parameter Configuration           | 379  |

## B828-016 5 V TTL Output, Overview

### General Characteristics

The B828-016 5 V TTL output module converts logic signals used within the controller into sixteen independent 5 V TTL outputs. These outputs are compatible with TTL and DTL logic as well as other loads such as LED displays. The module uses sixteen transistor switches which are capable of sinking load currents up to 75 mA supplied from an external 5 Vdc power source.

### Simplified Schematic

Following is a simplified schematic of the B828-016 5 V TTL output module.

## B828–016 5 V TTL Output, Field Connections

### Overview

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

### Terminal Numbering and Output Connections

The following diagram shows terminal numbering and output connections for the B828–016 5 V TTL output module.

## B828–016 5 V TTL Output, Specifications

### Specification Table

The following table provides the specifications for the unit.

| B828–016 Specifications |        |                                                                                                              |

# Chapter 36

## B829–116 Fast Response 5 V TTL Input

---

**Purpose**

This chapter describes the functional and physical characteristics of the B829–116 fast response 5 V TTL input module.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                                   | Page |
|---------------------------------------------------------|------|
| B829–116 Fast Response 5 V TTL Input, Overview          | 382  |
| B829–116 Fast Response 5 V TTL Input, Field Connections | 383  |
| B829–116 Fast Response 5 V TTL Input, Specifications    | 384  |
| B829–116 Parameter Configuration                        | 385  |

## B829-116 Fast Response 5 V TTL Input, Overview

### General Characteristics

The B829-116 fast response 5 V TTL input module converts signals from 16 independent 5 V logic-compatible inputs into signals used by the PLC. Each input is capable of conditioning signals from TTL devices or DTL devices for use by the PLC.

### Simplified Schematic

Following is a simplified schematic of the B829-116 fast response 5 V TTL input module.

## B829-116 Fast Response 5 V TTL Input, Field Connections

### Overview

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

### Terminal Numbering and Input Connections

The following diagram shows terminal numbering and input connections for the B829-116 fast response 5 V TTL input module

## B829–116 Fast Response 5 V TTL Input, Specifications

### Specification Table

The following table provides the specifications for the unit.

| B829–116 Specifications |           |                                                                         |
|-------------------------|-----------|-------------------------------------------------------------------------|
| Description             |           | 5 V TTL 16-point                                                        |
| Number of Points        |           | 16                                                                      |
| Operating Voltage       |           | 5 V                                                                     |

# Chapter 37

## B832–016 24 Vdc Output (True Low)

---

**Purpose**

This chapter describes the functional and physical characteristics of the B832–016 24 Vdc (True Low) output module.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                                | Page |
|------------------------------------------------------|------|
| B832–016 24 Vdc Output (True Low), Overview          | 388  |
| B832–016 24 Vdc Output (True Low), Field Connections | 389  |
| B832–016 24 Vdc Output (True Low), Specifications    | 390  |
| B832–016 Parameter Configuration                     | 391  |

## B832-016 24 Vdc Output (True Low), Overview

### General Characteristics

The Modicon B832-016 24 Vdc (True Low) output module consists of a single group of 16 independent outputs. The B832-016 converts signals used within the PLC into 16 independent 24 Vdc outputs. These outputs are capable of driving indicators, relays, and a variety of other loads. Sixteen transistor switches are used to control loads connected to an external power source. Sixteen transistor switches are used to control loads connected to an external power source.

### Simplified Schematic

Following is a simplified schematic of the B832-016 24 Vdc (True Low) output module.

## B832-016 24 Vdc Output (True Low), Field Connections

### Overview

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

### Terminal Numbering and Output Connections

The following diagram shows terminal numbering and output connections for the B832-016 24 Vdc (True Low) output module.

## B832-016 24 Vdc Output (True Low), Specifications

### Specification Table

The following table provides the specifications for the unit.

| B832-016 Specifications |                |                                                                           |
|-------------------------|----------------|---------------------------------------------------------------------------|
| Description             |                | 24 Vdc output                                                             |
| Type of Operation       |                | True low                                                                  |

## B833-016 24 Vdc Input (True Low), Overview

### General Characteristics

The B833-016 24 Vdc (True Low) input module consists of two groups of eight independent inputs. The B833-016 senses and converts switched input signals into logic voltage levels used by the PLC.

Inputs can be received from push buttons, limit and proximity switches, and other 24 Vdc sources. The module provides 16 inputs that share an external power supply. Input voltages are sensed by comparing the incoming voltage against a fixed threshold.

### Simplified Schematic

Following is a simplified schematic of the B833-016 24 Vdc (True Low) input module.

## B833-016 24 Vdc Input (True Low), Field Connections

### Overview

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

### Terminal Numbering and Input Connections

The following diagram shows terminal numbering and input connections for the B833-016 24 Vdc (True Low) input module.

## B833-016 24 Vdc Input (True Low), Specifications

### Specification Table

The following table provides the specifications for the unit.

| B833-016 Specifications |        |                                                                                                                     |
|-------------------------|--------|---------------------------------------------------------------------------------------------------------------------|
| Description             |        | 24 Vdc true low input                                                                                               |
| Type of Operation       |        | True low                                                                                                            |
| Number of Points        |        | 16                                                                                                                  |
| Operating Voltage       |        | 20—28 Vdc                                                                                                           |
| Number of Groups        |        | 2                                                                                                                   |
| Outputs/group           |        | 8                                                                                                                   |
| Maximum Input Voltage   |        | 100 Vdc for 3 ms                                                                                                    |
| ON Conditions           |        | $\leq 2.6$ Vdc or $.13$ of $V_s$ , whichever is greater. 200 $\Omega$ max resistance to common. Input indicator ON. |
| OFF Conditions          |        | $\geq 21$ Vdc or $.75$ of $V_s$ , whichever is less. 10,000 $\Omega$ min resistance to common. Input indicator OFF. |
| Maximum Response Time   | OFF→ON | 11 ms                                                                                                               |
|                         | ON→OFF | 11 ms)                                                                                                              |

| B836-016 12—250 Vdc Isolated Output, Specifications    | 403  |
| B836-016 Parameter Configuration                       | 404  |

## B836-016 12—250 Vdc Isolated Output, Overview

### General Characteristics

The B836-016 12—250 Vdc isolated output module accepts up to 16 signals from a 984 PLC and converts them to independent outputs. The module's essential function is to switch one or more field circuits off

At any given time, one or more output channel's signals may be in a true high configuration while one or more of the remaining output channel's signals are in a true low configuration. The output signals are capable of driving displays, relays, lamps, or any load connected to a 12—250 Vdc user supplied voltage source. Finally, the module is fused against overload currents and protected from accidental polarity reversal.

Since all of the 16 circuits are the same, describing one circuit's function describes the module's function.

Data commands from the controller are shipped via OURBUS to the OBS communications chip in the B836-016 module via Modicon's standard data interface. The OBS chip directs the signal to the addressed channel which in turn feeds the transistor driver, couples through the ISOGATE and turns the field effect transistor (FET) switch on. Since the circuit is a completely floating arrangement, it is equally useful in a true high (sourcing) or true low (sinking) configuration.

### Simplified Schematic Diagram

Following is a simplified block diagram of the B836-016 12—250 Vdc isolated output module.

**NOTE:** Certain large inductive load conditions may require external reverse diodes placed directly across the load for complete circuit protection.

## B836-016 12—250 Vdc Isolated Output, Field Connections

### Overview

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

### Terminal Numbering and Output Connections

The following figure shows the terminal numbering and output connections required.

Typical User-Side Field Connector Circuitry

The following figure shows an example of typical user-side field connector circuitry.

| B837–016 Parameter Configuration                         | 409  |

## B837-016 24 Vac/Vdc Input (True High), Overview

### General Characteristics

The B837-016 24 Vac/Vdc (True High) input module senses off and on input signals from its field circuitry and converts them to logic levels used by a Modicon PLC. The module's 16 inputs are separated into two groups of eight channels, each group being totally isolated from the other.

Although both groups use common return wires, none has a definite relationship to system ground unless established in the user's field circuitry. Since both groups nominally employ independent power return sources, both ac and dc powered field circuits may input to the module at the same time.

### Simplified Schematic Diagram

Following is a simplified block diagram of the B837-016 24 Vac/Vdc (True High) input module.

When the user's ac/dc powered field circuit goes on - as the result of a limit switch for example - it presents the field power voltage at the modules appropriate input channel. When the input voltage meets or exceeds the module's guaranteed on threshold, the resulting voltage turns the channel monitor lamp on, current flows through the bridge rectifier and subsequently the opto-isolator (OPTO-ISOL) circuit.

Given a nominal 24 V field power supply and 1000Ω maximum input source impedance, the module's channel monitor lamps will indicate on and off when voltages are 20.4 Vac/19.2 Vdc for the high level on; and 6 Vac/10 Vdc for the low level off respectively. The optical energy goes to the communications board (COMM BOARD) where the Ourbus output register is set to represent the field circuit's on state. As long as the field input status remains true, the module will communicate this status each time it is polled by the controller.

**NOTE:** Reversal of external signal polarity will not cause channel circuit damage as circuit design is indifferent to accidental polarity reversal.

## B837-016 24 Vac/Vdc Input (True High), Field Connections

### Overview

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

### Terminal Numbering and Input Connections

The following diagram shows terminal numbering and input connections for the B837-016 24 Vac/Vdc True High input module.

**NOTE:** To use both input groups with a single power supply, jump terminals #9 and #19.

# Chapter 41

## B838–032 24 Vdc Output (True High)

---

**Purpose**

This chapter describes the functional and physical characteristics of the B838–032 24 Vdc (True High) output module.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                                 | Page |
|-------------------------------------------------------|------|
| B838–032 24 Vdc Output (True High), Overview          | 412  |
| B838–032 24 Vdc Output (True High), Field Connections | 413  |
| B838–032 24 Vdc Output (True High), Specifications    | 414  |
| B838–032 Parameter Configuration                      | 416  |

## B838-032 24 Vdc Output (True High), Overview

### General Characteristics

The B838-032 24 Vdc (True High) output module consists of a four groups of eight outputs for a total of 32 outputs. The B838-032 converts logic signals used within the PLC into 32 24 Vdc outputs.

Outputs are capable of driving relays, pilot lamps, and other loads rated at 1/4 A. Each group of eight share an external supply voltage and is fused at 6.3 A. The outputs are designed to withstand the extreme voltage transients often encountered in an industrial environment.

### Simplified Schematic Diagram

Following is a simplified schematic of the B838-032 24 Vdc (True High) output module.

## B838-032 24 Vdc Output (True High), Field Connections

### Overview

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

### Terminal Numbering and Output Connections

The following diagram shows terminal numbering and output connections for the B838-032 24 Vdc (True High) output module.

## B838-032 24 Vdc Output (True High), Specifications

### Specification Table

The following table provides the specifications for the unit.

| B838-032 Specifications                |                       |                                                                                                                                                                                                                                                                                                                                                                                                             |

|                                        | ON State Voltage Drop | 1.0 Vdc @ 1/2 A @ full power                                                                                                                                                                                                                                                                                                                                                                                |
| Load Current                           | Continuous Current    | 0.50 A max / output, 16 A/module maximum                                                                                                                                                                                                                                                                                                                                                                    |
|                                        | Surge Current         | The surge current of the B838 is 2.5 A for 0.5 ms, and should not be exceeded. If a short circuit (momentary or sustained) exists, the FET on the output may fail prior to the group fuse blowing. Modicon recommends one of the following options to protect the outputs: 1) Add external fuses to each output (1 - 1.5 A fast blow), 2) Add external current limiting resistors to protect the output FET |

## B840–108 Relay Output, Overview

### General Characteristics

The B840–108 relay output module converts signals from the 800 series Ourbus to eight independent relay outputs. Each output is capable of driving relays, pilot lamps, or other loads up to 2 A.

The module utilizes eight high-reliability mercury-wetted relays to control the loads. Each of the eight outputs is electrically isolated from the I/O bus and from the other seven outputs by the relay coil. These outputs are capable of switching 100 VA maximum instantaneous power associated with ac or dc loads. Such devices may range from relays and pilot lamps to multiplexed low level analog signals.

Each output has an RC snubber to protect the mercury wetted contacts from arcing caused by rapid rate of rise of applied voltage from inductive loads upon instantaneous opening of the contacts. The output signals can withstand severe voltage transients that may be encountered in industrial environments—i.e., the voltage transients will not propagate through the relay to the Ourbus, thus protecting all other controller system components from damage. All output circuits are also fused to protect against overload currents.

### Simplified Schematic Diagram

Following is a simplified schematic diagram of the B840–108 relay output module.

The module is user-configurable as to setting up for normally-open or normally-closed operation of the relays as described below. You can also optionally configure the RC snubber circuit to remove it when minimal leakage current applications such as data multiplexing are being used.

The logic interface chip samples the eight logic level signals simultaneously from the PLC on each scan and holds these samples to drive the appropriate reed relay coil. Assuming a normally-open jumpered configuration, when the relay coil is energized, the reed relay contacts conduct current from the output A terminal to the output B terminal.

### Configuration

The B840-108 relay module is initially shipped with all 8 channels jumpered for the normally-open configuration with all snubber circuits connected. You may wire any of the channels for either normally-open or normally-closed operation by transferring a wire jumper from one tab to another on the printed circuit board to change from normally-open to normally-closed

The following illustration shows the user wiring configuration for the B840-108 relay module

| CHAN | RELAY  |        |
|------|--------|--------|
|      | N.O.   | N.C.   |
| 1    | W1-E2  | W1-E1  |
|      |        |        |
| 2    | W2-E4  | W2-E3  |
|      |        |        |
| 3    | W3-E6  | W3-E5  |
|      |        |        |
| 4    | W4-E8  | W4-E7  |
|      |        |        |
| 5    | W5-E10 | W5-E9  |
|      |        |        |
| 6    | W6-E12 | W6-E11 |
|      |        |        |
| 7    | W7-E14 | W7-E13 |
|      |        |        |
| 8    | W8-E16 | W8-E15 |
|      |        |        |

| CHAN | SNUBBER |     |
|------|---------|-----|
|      | IN      | OUT |
| 1    |         |     |
|      | JP1     | JP1 |
| 2    |         |     |
|      | JP2     | JP2 |
| 3    |         |     |
|      | JP3     | JP3 |
| 4    |         |     |
|      | JP4     | JP4 |
| 5    |         |     |
|      | JP5     | JP5 |
| 6    |         |     |
|      | JP6     | JP6 |
| 7    |         |     |
|      | JP7     | JP7 |
| 8    |         |     |
|      | JP8     | JP8 |

The snubber circuits are disconnected by removing the (JP1-JP8) appropriate jumper. Refer to the label on the side of the module.

## B840-108 Relay Output, Field Connections

### Overview

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

### Terminal Numbering and Output Connections

The following diagram shows terminal numbering and output connections for the B840-108 relay output module.

**NOTE:** Since each output is isolated from the remaining outputs, separate power sources can be used for each load. Each output can be wired for current source or current sink operation.

**NOTE:** It is possible to have the active indicator lit when one or more output channels are working improperly

## 840–108 Relay Output, Specifications

### Specification Table

The following table provides the specifications for the unit.

| 840–108 Specifications                              |                       |                                                                          |

## B842–008 Reed Relay Output

---

**Purpose**

This chapter describes the functional and physical characteristics of the B842–008 reed relay output module.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                         | Page |
|-----------------------------------------------|------|
| B842–008 Reed Relay Output, Overview          | 424  |
| B842–008 Reed Relay Output, Field Connections | 425  |
| 842–008 Reed Relay Output, Specifications     | 426  |
| B842–008 Parameter Configuration              | 427  |

## B842-008 Reed Relay Output, Overview

### General Characteristics

The B842-008 reed relay output module, normally closed, converts the signals used on the 800 series OURBUS to 8 independent mercury wetted reed relay outputs capable of driving relays, pilot lamps, or other loads up to 2.0 amperes, or low level circuits such as analog multiplexing.

The module uses eight high reliability mercury wetted reed relays to control loads. Each output is electrically isolated from the I/O Bus and from the other seven outputs by the coil of the relay and will withstand the severe voltage transients normally encountered in industrial environments without damage or adverse effect on the controller.

Self-contained resistor and capacitor snubber networks suppress transient voltages when inductive loads are driven and provides contact protection. The eight outputs are also fused to protect their circuitry against overload currents.

The B842-008 reed relay output module is compatible with input modules.

### Simplified Schematic

Following is a simplified schematic of the B842-008 reed relay output module.

## B842-008 Reed Relay Output, Field Connections

### Overview

This module performs in a rigid wiring system where the user connections are made to terminal strips attached to the front of the card basket. The I/O modules slide in slots of the card basket and make contact with the terminal strips via the mating connector.

User connections are made to standard screw-type terminals capable of securing up to two AWG 14 solid or stranded wires per terminal. Terminals are numbered from one at the top to 20 at the bottom as shown in the figure.

The data bus connections are made via the standard OURBUS interface connector to a shielded backplane at the rear of the card basket. The module may be placed in any location in the I/O struction without interfering with any other module's operation. When the module is inserted into the card basket, it picks up a low impedance earth shield ground by connecting the module's shield to the backplane's earth shield ground.

### Terminal Numbering and Output Connections

The following figure shows typical circuit connections for power applications of the B842-008 module.

**NOTE:** Since each output is isolated from the remaining outputs, separate power sources can be used for each load. Each output can be wired for current source or current sink operations.

**NOTE:** It is possible to have the active indicator lit with one or more output channels working improperly.

## 842-008 Reed Relay Output, Specifications

### Specification Table

The following table provides the specifications for the unit.

| 842-008 Specifications |                 |                                                                                                                                                             |

# Chapter 44

## B849–016 48 Vac/Vdc Input (True High)

---

**Purpose**

This chapter describes the functional and physical characteristics of the B849–016 48 V ac/dc (True High) input module.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                                    | Page |
|----------------------------------------------------------|------|
| B849–106 48 Vac/Vdc Input (True High), Overview          | 430  |
| B849–016 48 Vac/Vdc Input (True High), Field Connections | 431  |
| 849–016 48 Vac/Vdc Input (True High), Specifications     | 432  |
| B849–016 Parameter Configuration                         | 433  |

## B849–106 48 Vac/Vdc Input (True High), Overview

### General Characteristics

The B849–016 48 V ac/dc input module senses off and on input signals from its field circuitry, converting them to logic levels used by a PLC. The module's 16 input circuits are divided into two groups of eight channels, each group totally isolated from the other.

Although both groups use common return wires, none has a definite relationship to system ground unless established in the user's field circuitry. Since both groups nominally employ independent power return sources, both ac and dc powered field circuits may input to the module at the same time.

**NOTE:** Reversal of external signal polarity will not cause channel circuit damage as circuit design is indifferent to accidental polarity reversal.

### Simplified Block Diagram

Following is a simplified block diagram of the B849–016 48 V ac/dc input module.

When the user's ac/dc powered field circuit goes on — as the result of a limit for example — it presents the field power voltage at the modules appropriate input channel. When the input voltage meets or exceeds the module's guaranteed on threshold, the resulting voltage turns the channel monitor lamp on, current flows through the bridge rectifier and subsequently the opto-isolator (OPTO-ISOL) circuit.

Given a nominal 115 Vac/125 Vdc field power supply and a k $\Omega$  maximum input source impedance, the module's channel monitor lamps will indicate on and off when input voltages are 80 Vac/85 Vdc for the high level on; and 35 Vac/40 Vdc for the low level off respectively.

The optical energy goes to the communications board (COMM BOARD) where the OURBUS output register is set to represent the field circuit's on state. As long as the field input status remains true, the module will communicate this status each time it is polled by the controller. Total scan time may be as long as 250 ms. The user should not attempt to monitor events with a repetition rate greater than 1/s without analyzing his actual system, program, and scan time.

**NOTE:** It is possible to have the active indicator lit with one or more input channels working improperly.

## B849–016 48 Vac/Vdc Input (True High), Field Connections

### Overview

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

### Terminal Numbering and Input Connections

The following diagram shows terminal numbering and input connections for the B849–016 48 V ac/dc input module.

**NOTE:** To use both input groups with a single power supply, jump terminals #9 and #19.

## B853-016 115 Vac/125 Vdc Input (True High), Overview

### General Characteristics

True High input module B853-016 115-Vac/125-Vdc senses off and on input signals from its field circuitry, converting them to logic levels used by a PLC. The module's 16 input circuits are divided into two groups of eight channels, each group being totally isolated from the other.

Although both groups use common return wires, none has a definite relationship to system ground unless established in the user's field circuitry. Since both groups nominally employ independent power return sources, both ac and dc powered field circuits may be directed to the module at the same time.

**NOTE:** Reversal of external signal polarity will not cause channel circuit damage as the circuit design is indifferent to accidental polarity reversal.

### Simplified Block Diagram

Following is a simplified schematic of the True High input module B853-016 115-Vac/125-Vdc

When the user's ac/dc powered field circuit goes on—as the result of a limit switch, for example—it presents the field power voltage at the module's appropriate input channel. When the input voltage meets or exceeds the module's on threshold, the resulting voltage turns the channel monitor lamp on, current flows through the bridge rectifier and subsequently the opto-isolator (OPTO-ISOL) circuit.

Given a nominal 115 Vac/125 Vdc field power supply and a k $\Omega$  maximum input source impedance, the module's channel monitor lamps will indicate on and off when input voltages are 80 Vac/85 Vdc for the high level on; and 35 Vac/40 Vdc for the low level off respectively.

The optical energy goes to the communications board (COMM BOARD) where the OURBUS output register is set to represent the field circuit's on state. As long as the field input status remains true, the module will communicate this status each time it is polled by the controller. Total scan time may be as long as 250 ms. The user should not attempt to monitor events with a repetition rate greater than 1/s without analyzing his actual system, program, and scan time.

**NOTE:** It is possible to have the active indicator lit with one or more input channels working improperly.

## B853–016 115 Vac/125 Vdc Input (True High), Field Connections

### Overview

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

### Terminal Numbering and Input Connections

The following diagram shows terminal numbering and input connections for the B853–016 115 Vac/125 Vdc (True High) input module.

**NOTE:** To use both input groups with a single power supply, jump terminals #9 and #19.

## B853–016 115 Vac/125 Vdc Input (True High), Specifications

### Specification Table

The following table provides the specifications for the unit.

| 853-016 Specifications |            |                                                                                                       |
|------------------------|------------|-------------------------------------------------------------------------------------------------------|

# Chapter 46

## B855–016 Intrinsically Safe Input

---

**Purpose**

This chapter describes the functional and physical characteristics of the B855–016 intrinsically safe input module.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                             | Page |
|---------------------------------------------------|------|
| B855–016 Intrinsically Safe Input, Overview       | 442  |
| B855–016 Intrinsically Safe Input, Installation   | 443  |
| B855–016 Intrinsically Safe Input, Specifications | 447  |
| B855–016 Parameter Configuration                  | 449  |

## B855-016 Intrinsically Safe Input, Overview

### General Characteristics

The B855-016 intrinsically safe (fully isolated) input module accepts 16 switch closures or low impedance discrete inputs less than 100  $\Omega$  and operates in any 800 series I/O slot.

The B855 module monitors hazardous area contact closures. The B855 can operate in either continuously or intermittently hazardous environments containing acetylene, hydrogen, ethylene or methane gases; metal, coal or grain dust, and fibers. The B855-016 module meets factory mutual standard FM 3610 for intrinsically safe connections to field side associated apparatus.

The B855-016 module has 16 discrete inputs. The inputs work in the range 11.4-12.6 Vdc, True Low.

## B855–016 Intrinsically Safe Input, Installation

### Installation Procedure

Installation of the B855–016 module involves unpacking the module, wiring the field connector, installing key pins, and mounting the module into the housing.

| Step | Procedure                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Remove the module from its shipping box and check for damage. If damaged, contact your vendor for instructions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 2    | Ensure power to housing is off.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 3    | Designate the housing slot for this module.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 4    | Locate required connector assembly (Part number AS-8535-000). This assembly consists of two 20-pin connectors.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 5    | Referring to the hazardous area and safe area wiring diagram below, connect field side wiring to proper pins on the field connector. You must wire the hazardous area connections, pins 9-40, separately from the safe area connections. Wire the dc source to the safe area connections, pins 1 and 2. Refer to Caution, below.                                                                                                                                                                                                                                                                                                                                                                                                    |
| 6    | Refer to the intrinsically safe barrier strip diagram below. Remove the two Phillips head screws from the top 20-pin connector of the AS-8535-000. Take the intrinsically safe barrier strip out of the white bag attached to the handle of the module. Place the intrinsically safe barrier strip on the left side of the top 20-pin connector between pins 3, and 8. Make sure the raised edge of the intrinsically safe barrier strip is facing away from the black wiring duct. Insert this subassembly inside the black wire duct while aligning the two screw holes. Insert the two Phillips head screws and tighten them down. Note: You must use key pins (shipped with this module) to meet factory mutual's requirements. |
| 7    | Referring to typical field circuit connections illustration, below, connect field side wiring to proper pins on the field connector. Note: The external 12 Vdc (5%) power supply for the module should be a minimum of 1.0 A                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 8    | Insert the module into the housing, firmly but carefully, seating the edge connector in the backplane.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 9    | Secure module to housing using captive slotted mounting screws at the top and bottom of the module front panel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 10   | Note:<br>To meet factory mutual's requirements, Schneider Electric recommends the MD-8741-000 intrinsically safe barrier strip.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

The following illustration shows the B855-016 hazardous area and safe area wiring.

The following illustration shows the B855-016 intrinsically safe barrier strip.

The following illustration shows the typical field circuit connections.

## B855–016 Intrinsically Safe Input, Specifications

## B862–001 Register Output

---

**Purpose**

This chapter describes the functional and physical characteristics of the B862–001 register output module.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                       | Page |
|---------------------------------------------|------|
| B862–001 Register Output, Overview          | 452  |
| B862–001 Register Output, Switch Settings   | 453  |
| B862–001 Register Output, Field Connections | 454  |
| B862–001 Register Output, Specifications    | 457  |
| B862–001 Parameter Configuration            | 458  |

## B862-001 Register Output, Overview

### Overview

The B862-001 register output module provides a 5 V TTL or CMOS-compatible interface between a PLC and peripheral field devices. The B862-001 register output module operates in either BCD or binary mode.

The desired mode is operator selectable, with the 16-bit output either having BCD values in the range 0000 to 9999 or binary output in the range 0000 (HEX) to FFFF (HEX).

The B862-001 is a 4-channel register output module with four 16-bit registers. A channel is defined as a 16-bit data path. The channels can be configured as 4 BCD or 4 binary registers via an appropriate switch setting.

The module is organized in a group strobe arrangement with the 16 datalines associated at a given moment with one of the 4 strobe lines. Each strobe line addresses one of the devices on the data bus and enables it to transmit data to a given peripheral device to the exclusion of the other devices. The data lines are routed to all devices. The B862-001 is operated in module-select mode. In module-select mode, all 4 data registers are transferred in a single OURBUS cycle.

The following is a simplified block diagram of the unit.

# B862-001 Register Output, Switch Settings

## Switch Settings

Two toggle switches are located at the top left of the module and are used to determine the type of communication with external devices. Both switches are user selectable.

1. Bin/BCD Switch

This toggle switch determines whether the output data is to be interpreted by the target devices as a BCD or a binary value.

2. Strobes Active Hi/Lo Switch

This toggle switch allows selection of either true-hi or true-lo for strobing output data.

**NOTE:** The relation between the I/O map selection, the BCD/binary switch setting, and the results at the output are summarized in the following table:

## Table

The following table identifies the relationship between the switch and I/O map facility.

| I/O Map Selection | B862 Switch Setting | Result    |
|-------------------|---------------------|-----------|
| Binary            | BCD                 | BCD       |
| Binary            | Binary              | Binary    |
| BCD               | BCD                 | Erroneous |
| BCD               | Binary              | BCD       |

# B862-001 Register Output, Field Connections

## Terminal Numbering and Output Functions

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

The following illustration shows how to field connect the unit.

### Pull-up Resistor Connection

Pull-up resistors must be installed at the active device end to use the B862 output module. The value of the pull-up resistor depends upon the number of devices that are attached to the data bus, as explained below. Each output meets 0.4 V maximum at 16 mA for a logic low and 3.3 V minimum at 16 mA for a logic high. If the current limit has been exceeded, the pull-up resistor values should be adjusted within specification; otherwise, spurious results may be obtained.

The following illustration indicates how the resistors are connected at the device end. For a single device consisting of 16 data lines, 16 1 k resistors are required, or, one 1 k resistor per data line. As additional devices are added to the data bus, the value of the pull-up resistor must be increased by 1 k. In other words, if two devices are used, the pull-up resistor must be 2 k, three devices require a 3 k pull-up, and so on, with the maximum number of 8 devices requiring 8 k of pull-up for each data line.

### Pull-up resistor connection

**NOTE:** Increase pull-up resistor value by 1 k for each additional device.

## B862–001 Register Output, Specifications

### Specification Table

The following table provides the specifications for the unit.

| B862-001 Specifications   |                   |                                                                            |
|---------------------------|-------------------|----------------------------------------------------------------------------|
| Description               |                   | TTL register output                                                        |

| B863–032 Parameter Configuration                   | 466  |

## B863-032 Monitored 24 Vdc Input, Overview

## General Characteristics

The B863-032 monitored dc input module (B863) is a 32 point, 24 Vdc, true high, 800 Series, module capable of determining the state of switches, relays, solenoids, lamps, proximity switches, and other 24 Vdc powered devices. In addition, the B863-032 monitors itself to insure its ability to detect high or low states at its inputs.

This feature is designed to provide an extra margin of reliability in safety shutdown systems. This is accomplished with a module resident diagnostic test. The diagnostics verify the module's functionality by momentarily forcing all inputs to a low state followed by a high state. This forcing function is transparent to the input source.

### Simplified Schematic

Following is a simplified schematic of the B863–032 monitored 24 Vdc input module.

This diagnostic test is performed at a rate of 1/s, and takes less than 1 ms. The inability of an input to detect a low or high state during diagnostics, results in the reporting of a fault to the controller, and the flashing of the active LED. Digital filtering is performed on all inputs to reduce the occurrence of nuisance faults. Communication between the module and the controller consists of four words. Two words contain the state of each input, and the other two words contain the fault status of each input. Within the state words, a high, or one indicates a on condition. Within the fault status words, a high, or one indicates a fault at the respective input.

## B863-032 Monitored 24 Vdc Input, Field Connections

### Overview

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

### Terminal Numbering and Input Connections

The following diagram shows terminal numbering and input connections for the B863-032 monitored 24 Vdc input module.

Note: Pins 20 and 40 are internally connected together

## B863–032 Monitored 24 Vdc Input, Quick Start Test

### Quick Start Test Procedure

This test configures the module as follows: B863 (4 register binary).

| Step | Action                                                                                                                                                                                                                                                                                                 |
|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Stop the controller.                                                                                                                                                                                                                                                                                   |
| 2    | Determine which channel and slot location are being used for this module and insert the module.                                                                                                                                                                                                        |
| 3    | Wire +24 Vdc external power supply to terminal 18, and connect common to terminal 20 on a AS-8535-000 high density connector. Do not connect any other field wiring to the connector.<br><br><b>NOTE:</b> Remove the keying tabs on the AS-8535-000 high density connector prior to installing module. |
| 4    | Turn ON the external 24 Vdc power supply. The Field Power light will come ON.                                                                                                                                                                                                                          |
| 5    | I/O Map the module as a B863, four register inputs 30001 ... 30004 binary. Recall that the first two registers are used for real inputs, and the last two registers are error flags.                                                                                                                   |
| 6    | Start the controller.                                                                                                                                                                                                                                                                                  |
| 7    | Confirm that the module's active light is illuminated.<br>Note: Active on steady = OK. Active blinking = Check the 24 Vdc external power supply voltage and wiring.                                                                                                                                    |
| 8    | View the B863 I/O mapped registers, 30001 ... 30004 on the reference screen in binary format.                                                                                                                                                                                                          |
| 9    | Verify that all the points are zero.<br>The first two registers, 30001 and 30002 are real inputs. Open inputs to the module reads 0. The second two registers, 30003 and 30004 are error flags. A value of 1 in any of these error flag points indicates a faulty input.                               |
| 10   | Turn OFF the external 24 Vdc power supply, and all error flag points change to 1.                                                                                                                                                                                                                      |
| 11   | Turn ON the external 24 Vdc power supply, and all error flag points change back to 0.                                                                                                                                                                                                                  |
| 12   | To test an input, connect a wire from the +24 Vdc point on the connector terminal 18, and touch the other end of the wire to terminal 1. Bit 1 in 30001 goes from 0 to 1. The error flag for input 1 is found at bit 1 in register 30003. When the input is functional this reads 0.                   |

### Application Example 1

The B863 module not only reads 24 Vdc inputs, but it allows you to monitor the health of the input circuits through the use of the input error flags. In the following example, networks allow you to monitor the error flag inputs for maintenance and troubleshooting. If the B863 module is I/O mapped as 30001-30004, then registers 30001 and 30002 are the real world inputs, and 30003 and 30004 become the error flag inputs.

Comparison of registers 30003 and 30004 to registers 40011 and 40012.

**NOTE:** 40011 and 40012 must be initialized to zero.

### Application Example 2

If a miscompare is detected then output 10 goes ON and 40010 will contain the bit with the error as shown in the following illustration. These error bits are stored in an error table through the R-T function block. The MBIT function block sets the same bit in matrix B so the input at fault is not placed into the error table on every scan.

The following table shows how a failure of input 15 would look in the error table.

| B863-032 Input 15 Error Table |                                |
|-------------------------------|--------------------------------|
| Register                      | Data                           |
| 40100                         | 0001 " Pointer to Table        |
| 40101                         | 0015 " Fault with Input Bit 15 |
| 40102                         | 0000                           |
| 40103                         | 0000                           |
| ... .                         | ... .                          |
| 40110                         | 0000                           |

The following figure shows matrix A input registers (30003 and 30004) and how a failure of input 15 or bit 15 looks. When the error is corrected, the error table and pointer should be cleared to 0.

## B863–032 Monitored 24 Vdc Input, Specifications

### Specifications

B863–032, specification table

# Chapter 49

## B863–132 24 Vdc Input

---

**Title of overview block**

This chapter describes the functional and physical characteristics of the B863–132 24 Vdc input module.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                    | Page |
|------------------------------------------|------|
| B863–132 24 Vdc Input, Overview          | 468  |
| B863–132 24 Vdc Input, Switch Settings   | 469  |
| B863–132 24 Vdc Input, Field Connections | 470  |
| B863–132 24 Vdc Input, Configuration     | 471  |
| B863–132 24 Vdc Input, Specifications    | 472  |
| B863–132 Parameter Configuration         | 473  |

## B863–132 24 Vdc Input, Overview

### General Characteristics

The B863–132 24 Vdc input module senses and converts switched input signals into logic voltage levels used by the PLC. This module senses and reports broken wire faults. The module is designed for safety applications whereby it monitors essential field wiring. This module satisfies applications where connectivity diagnostics are important to the process. A logic side LED indicates the logic state that is written into the state table.

### Simplified Schematic

Following is a simplified schematic of the B863–132 24 Vdc input module.

# B863-132 24 Vdc Input, Switch Settings

## Switch Settings

A four-position DIP switch located on the rear of the module (see diagram below) is used to select broken wire testing. Each individual switch relates to one of the four groups of eight input points. For example, DIP-Switch position #1 when set to off senses for broken wire faults for group 1 and so on; when set to on no fault is reported.

Only Binary should be used when operating module in line test mode. Do not use BCD.

The line test dip-switch settings are shown below.

line test switch four position DIP switch  
to of module

|          |                    |
|----------|--------------------|
| 1        | 0                  |
| on       | off                |
| left     | right              |
| up       | down               |
| switches | functions          |
| sw1 = 0  | group 1, line test |
| = 1      | group 1, no test   |
| sw2 = 0  | group 2, line test |
| = 1      | group 2, no test   |
| sw3 = 0  | group 3, line test |
| = 1      | group 3, no test   |
| sw4 = 0  | group 4, line test |
| = 1      | group 4, no test   |

**NOTE:** When using binary and BCD inputs remember that input 1 is the MSB and input 32 is the LSB.

# B863–132 24 Vdc Input, Field Connections

## Overview

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

## Terminal Numbering and Input Connections

The following diagram shows terminal numbering and input connections for the B863–132 24 Vdc input module.

## B863–132 24 Vdc Input, Configuration

### Configuration Guidelines

This module appears as a B863 module when configured. This means the module requires four 16-bit words (1x registers), as shown in the data registers diagram below. The first two words contains the state of the input points. The second two words contain the condition of the field wiring. If a broken wire is detected on input point, then a one is displayed in input register (1x+32) at its position. When the fault is fixed, a zero appears in the bit. A one indicates a detected fault, whereas, a zero indicates normal operation of that input point.

## B863–132 24 Vdc Input, Specifications

The following table provides the specifications for the unit.

|                       |                      |                                                                                                                                           |
|-----------------------|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------|

# Chapter 50

## B864–001 Register Output

---

**Purpose**

This chapter describes the functional and physical characteristics of the B864–001 register output module.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                       | Page |
|---------------------------------------------|------|
| B864–001 Register Output, Overview          | 476  |
| B864–001 Register Output, Switch Settings   | 477  |
| B864–001 Register Output, Field Connections | 478  |
| B864–001 Register Output, Specifications    | 481  |
| B864–001 Parameter Configuration            | 482  |

## B864-001 Register Output, Overview

### Overview

The B864-001 register output module provides a 5 V TTL or CMOS-compatible interface between a PLC and peripheral field devices. The B864-001 register output module operates in either BCD or binary mode. The desired mode is operator selectable, with the 16-bit output either having BCD values in the range 0000- 9999 or binary output in the range 0000- FFFF hex.

The B864-001 is an eight-channel register output module with eight 16-bit registers. A channel is defined as a 16-bit data path. The channels can be configured as eight BCD or eight binary registers via the appropriate switch setting.

The module is organized in a group strobe arrangement with the 16 datalines associated at a given moment with one of the eight strobe lines. Each strobe line addresses one of the devices on the data bus and enables it to transmit data to a given peripheral device to the exclusion of the other devices. The data lines are routed to all devices. The B864-001 is operated in module-select mode. In module-select mode, all eight data registers are transferred in a single ourbus cycle.

The following is a simplified block diagram of the unit.

# B864-001 Register Output, Switch Settings

## Switch Settings

Two toggle switches are located at the top of the module and are used to determine the type of communication with external devices. Both switches are user selectable.

1. Bin/BCD Switch

This toggle switch determines whether the output data is to be interpreted by the target devices as a BCD or a binary value.

2. Strobes Active Hi/Lo Switch

This toggle switch allows selection of either true-hi or true-lo for strobing output data.

**NOTE:** The relation between the I/O map selection, the BCD/binary switch setting, and the results at the output are summarized in the following table:

## Table

The following table identifies the relationship between the switch and I/O map facility.

| I/O Map Selection | B864 Switch Setting | Result    |
|-------------------|---------------------|-----------|
| Binary            | BCD                 | BCD       |
| Binary            | Binary              | Binary    |
| BCD               | BCD                 | Erroneous |
| BCD               | Binary              | BCD       |

## B864-001 Register Output, Field Connections

### Terminal Numbering and Output Functions

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

The following illustration shows how to field connect the unit.

### Pull-up Resistor Connection

Pull-up resistors must be installed at the active device end to use the B864 output module. The value of the pull-up resistor depends upon the number of devices that are attached to the data bus, as explained below. Each output meets 0.4 V maximum at 16 mA for a logic low and 3.3 V minimum at 16 mA for a logic high. If the current limit has been exceeded, the pull-up resistor values should be adjusted within specification; otherwise, spurious results may be obtained.

The following illustration indicates how the resistors are connected at the device end. For a single device consisting of 16 data lines, 16 1 K resistors are required, or, one 1 K resistor/data line. As additional devices are added to the data bus, the value of the pull-up resistor must be increased by 1 K. In other words, if two devices are used, the pull-up resistor must be 2 K, three devices require a 3 K pull-up, and so on, with the maximum number of 8 devices requiring 8 k of pull-up for each data line.

Pull-up resistor connection

**NOTE:** Increase pull-up resistor value by 1 K for each additional device.

## B864-001 Register Output, Specifications

### Specification Table

The following table provides the specifications for the unit.

| Module B864-001, Specification Table |        |                                                                             |
|--------------------------------------|--------|-----------------------------------------------------------------------------|
| Description                          |        | TTL register output                                                         |
| Number of Points                     |        | 8 channels, 16 data lines                                                   |

# Chapter 51

## B865–001 Register Input

---

**Purpose**

This chapter describes the functional and physical characteristics of the B865–001 register input module.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                       | Page |
|---------------------------------------------|------|
| B865–001 Register Input, Overview           | 484  |
| B865–001 Register Input, Switch Settings    | 486  |
| B865–001 Register Output, Field Connections | 487  |
| B865–001 Register Input, Specifications     | 490  |
| B865–001 Parameter Configuration            | 492  |

## B865–001 Register Input, Overview

The B865–001 register input module provides a 5 V TTL or CMOS-compatible interface between peripheral field devices and a PLC. The B865-001 is an eight-channel register module with eight 16-bit registers. A channel is defined as a 16-bit data path.

The module can operate in either BCD or binary mode. The desired mode is user-selectable, with the parallel 16-bit input having BCD values in the range 0000- 9999 and the binary input in the range 0000-FFFF.

The B865–001 operates in module-select mode, which updates the controller with eight input registers of new data samples on one scan period. The module-select feature ensures data integrity by sampling and comparing data from the user device twice during each channel's active strobe period. If the samples are equal, the data is accepted for further processing. If the samples are not equal, the old data is sent to the controller. If a channel has three consecutive no-compares, a 16-bit word containing all zeros is routed to the PLC.

The following diagram shows the schematic diagram for the B865-001 register input module.

The B865-001 operates with a 16-bit data path. Data is routed from a device by means of a strobe line associated with each device. The datalines are common to all devices while the strobe performs the addressing function.

The DC (data changing) signal from the field device is used for slowly changing data such as thumb wheel switches, and prevents erroneous information from being transferred to the PLC. This input needs only be used for slowly changing data that may cause the capture of erroneous information. The DC input connection is made on terminal 18 of the module's field side wiring strip.

## B865–001 Register Input, Switch Settings

### Switch Settings

Two toggle switches are located at the top of the module and are used to determine the type of communication with external devices. Both switches are user selectable.

1. Data Polarity Switch

This toggle switch allows selection of true-hi or true-lo input data.

2. Bin/BCD Switch

This toggle switch determines whether the input data is to be interpreted by the controller as a BCD or a binary value.

**NOTE:** The switch and I/O map relationship is summarized in the following table.

### Table

The following table identifies the relationship between the switch and I/O map facility.

| I/O Map Selection | B865 Switch Setting | Result    |
|-------------------|---------------------|-----------|
| Binary            | BCD                 | BCD       |
| Binary            | Binary              | Binary    |
| BCD               | BCD                 | Erroneous |
| BCD               | Binary              | BCD       |

## B865–001 Register Output, Field Connections

### Terminal Numbering and Input Functions

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

Terminal numbering and input functions are shown on the following illustration.

### Pull-up Resistor Connection

Resistive pull-ups of 2.2 k $\Omega$  10% for each strobe line must be provided. This is required on active devices only. Thumb wheel switches, for example, do not require the addition of pull-up resistors.

The recommended location for the pull-up resistors is at the device end of the circuit. However, they will work at the module end as well.

The following illustration shows a typical circuit setup.

**Strobe Type**

Strobe lines for the B865 module are true-low. The opposite is the case in other Modicon I/O modules. Therefore, when multiple thumb wheel inputs require diode isolation, the polarity of the diodes may have to be reversed.

# Chapter 52

## B868–001 Register Output

---

**Purpose**

This chapter describes the functional and physical characteristics of the B868–001 register output module.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                       | Page |
|---------------------------------------------|------|
| B868–001 Register Output, Overview          | 494  |
| B868–001 Register Output, Switch Settings   | 495  |
| B868–001 Register Output, Field Connections | 496  |
| B868–001 Register Output, Specifications    | 499  |
| B868–001 Parameter Configuration            | 500  |

## B868-001 Register Output, Overview

### Overview

The B868-001 register output module provides a 5 V TTL or CMOS-compatible interface between a PLC and peripheral field devices. The B868-001 register output module operates in either BCD or binary mode.

The desired mode is operator selectable, with the 16-bit output either having BCD values in the range 0000 to 9999 or binary output in the range 0000 (HEX) to FFFF (HEX).

The B868-001 is a 8-channel register output module with four 16-bit registers and is operated in channel select mode. In the channel select mode, only one channel (16-bit register width) is transferred during each cycle. This is accomplished by employing a simple form of handshaking with the PC. A channel select word is sent by the PC to the B868 module, directing it to send a specific channel to the addressed field device. The B868 then echos back to the controller the channel address of the last valid transmission. Channel select requires 1 input and 2 consecutive output registers. The input register contains the channel number echo, while the output registers contain the channel address and the data.

The following is a simplified block diagram of the unit.

# B868–001 Register Output, Switch Settings

## Switch Settings

Two toggle switches are located at the top left of the module and are used to determine the type of communication with external devices. Both switches are user selectable.

1. Bin/BCD Switch

This toggle switch determines whether the output data is to be interpreted by the target devices as a BCD or a binary value.

2. Strobes Active Hi/Lo Switch

This toggle switch allows selection of either true-hi or true-lo for strobing output data.

**NOTE:** The relation between the I/O map selection, the BCD/binary switch setting, and the results at the output are summarized in the following table:

## Table

The following table identifies the relationship between the switch and I/O map facility.

| I/O Map Selection | B868 Switch Setting | Result    |
|-------------------|---------------------|-----------|
| Binary            | BCD                 | BCD       |
| Binary            | Binary              | Binary    |
| BCD               | BCD                 | Erroneous |
| BCD               | Binary              | BCD       |

## B868-001 Register Output, Field Connections

### Terminal Numbering and Output Functions

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

The following illustration shows how to field connect the unit.

### Pull-up Resistor Connection

Pull-up resistors must be installed at the active device end to use the B868 output module. The value of the pull-up resistor depends upon the number of devices that are attached to the data bus, as explained below. Each output meets 0.4 V maximum at 16 mA for a logic low and 3.3 V minimum at 16 mA for a logic high. If the current limit has been exceeded, the pull-up resistor values should be adjusted within specification; otherwise, spurious results may be obtained.

The following illustration indicates how the resistors are connected at the device end. For a single device consisting of 16 data lines, 16 1 k resistors are required, or, one 1 k resistor per data line. As additional devices are added to the data bus, the value of the pull-up resistor must be increased by 1 k. In other words, if two devices are used, the pull-up resistor must be 2 k, three devices require a 3 k pull-up, and so on, with the maximum number of 8 devices requiring 8 k of pull-up for each data line.

## Pull-up Resistor Connection

**NOTE:** Increase pull-up resistor value by 1 k for each additional device.

## B868–001 Register Output, Specifications

### Specification Table

The following table provides the specifications for the unit.

| B868-001 Specifications   |                   |                                                                            |
|---------------------------|-------------------|----------------------------------------------------------------------------|
| Description               |                   | TTL register output                                                        |
| Number of Points          |                   | 8 channels, 16 data lines                                                  |

# Chapter 53

## B869–002 Register Input

---

**Purpose**

This chapter describes the functional and physical characteristics of the B869–002 register input module.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                       | Page |
|---------------------------------------------|------|
| B869–002 Register Input, Overview           | 502  |
| B869–002 Register Input, Switch Settings    | 504  |
| B869–002 Register Output, Field Connections | 505  |
| B869–002 Register Output, Specifications    | 508  |
| B869–002 Parameter Configuration            | 510  |

## B869-002 Register Input, Overview

### Overview

The B869-002 register input module provides a 5 V TTL or CMOS-compatible interface between peripheral field devices and a PLC. The B869-002 is capable of inputting numeric 4-digit BCD data, or 16-bit binary data from field devices to the controller.

The module can operate in either BCD or binary mode. The desired mode is user-selectable, with the parallel 16-bit input having BCD values in the range 0000 to 9999 and the binary input in the range 0000 (HEX) to FFFF (HEX).

The B869-002 is an 8 channel device that operates in a channel select mode. In the channel select mode, only one channel (16-bit register width) is transferred during each cycle. This is accomplished by employing a simple form of handshaking with the PC. A channel select word is sent by the PC to the module, requesting data from a specific channel. The module then responds by sending the requested data, together with a channel select echo. Channel select mode requires 1 output and 2 consecutive input registers. The output register (Channel Select Reg) contains the address of the selected channel, while the 2 input registers contain the channel number echo and the data, respectively.

## Schematic Diagram

The following figure shows the schematic diagram for the B869-002 register input module.

The B869-002 operates with a 16-bit data path. Data is routed in from a device by means of a strobe line associated with each device. The data lines are common to all devices while the strobe performs the addressing function. The channel select function permits the PC to transfer a single channel of 16 bits from a selected field device to the PC during one OURBUS cycle.

The DC (data changing) signal from the field device is used for slowly changing data such as thumb wheel switches and prevents erroneous information from being transferred to the PLC.

To avoid loading the bus when a device is not being addressed, any active device interfaced to the input module must have latched, tri-state, or open collector outputs.

## B869–002 Register Input, Switch Settings

### Switch Settings

Two toggle switches are located at the top of the module and are used to determine the type of communication with external devices. Both switches are user selectable.

1. Data Polarity Switch

This toggle switch allows selection of true-hi or true-lo input data.

2. Bin/BCD Switch

This toggle switch determines whether the input data is to be interpreted by the controller as a BCD or a binary value.

**NOTE:** The switch and I/O map relationship is summarized in the following table.

### Table

The following table identifies the relationship between the switch and I/O map facility.

| I/O Map Selection | B869 Switch Setting | Result    |
|-------------------|---------------------|-----------|
| Binary            | BCD                 | BCD       |
| Binary            | Binary              | Binary    |
| BCD               | BCD                 | Erroneous |
| BCD               | Binary              | BCD       |

## B869-002 Register Output, Field Connections

### Terminal Numbering and Input Functions

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

Terminal numbering and input functions are shown on the following illustration.

### Pull-up Resistor Connection

Resistive pull-ups of  $2.2\text{ k}\Omega \pm 10\%$  for each strobe line must be provided. This is required on active devices only. Thumb wheel switches, for example, do not require the addition of pull-up resistors.

The recommended location for the pull-up resistors is at the device end of the circuit. However, they will work at the module end as well.

The following illustration shows a typical circuit setup.

**Strobe Type**

Strobe lines for the B869 module are true-low. The opposite is the case in other I/O modules. Therefore, when multiple thumb wheel inputs require diode isolation, the polarity of the diodes may have to be reversed.

## B869–002 Register Output, Specifications

### Specification Table

The following table provides the specifications for the unit.

| B869-002 Specifications   |                   |                                                                                                              |
|---------------------------|-------------------|--------------------------------------------------------------------------------------------------------------|
| Description               |                   | TTL register output                                                                                          |
| Number of Points          |                   | 8 channels, 16 data lines                                                                                    |
| Operating Voltage         |                   | 5 V TTL                                                                                                      |
| Number of Groups          |                   | N/A                                                                                                          |
| Outputs/group             |                   | N/A                                                                                                          |
| Guaranteed Min. Levels    |                   | High State > 3.5 Vdc                                                                                         |
|                           |                   | Low State < 0.4 Vdc while sinking 16 mA                                                                      |
| Strobe Output Power       |                   | Two TTL loads @ 5 Vdc                                                                                        |
| Strobe Width Timing       |                   | 2 ms $\pm$ 10%                                                                                               |
| Data Set-up Time          |                   | Within 180 $\mu$ s after the strobe has gone active (LO), data must have stabilized on the field side inputs |
| Minimum Data Hold Time    |                   | 100 $\mu$ s must be provided by the user                                                                     |
| Response Time             |                   | 20 ms between a field data change and an I/O Comm (OURBUS) update                                            |
| Power Required            | +5 Vdc I/O        | 400 mA max.                                                                                                  |
|                           | +4.3 Vdc I/O      | 600 mA max.                                                                                                  |
| External Power Supply     |                   | +5 Vdc may be required for pull-up Vcc                                                                       |
| Field Device Requirements | TTL output level  | Low: < 0.8 Vdc @ 1.6 mA                                                                                      |
|                           |                   | High: > 2.4 Vdc @ 40 $\mu$ A                                                                                 |
|                           | CMOS output level | Low: < 1.6 Vdc @ 0.3 $\mu$ A                                                                                 |
|                           |                   | High: > 3.3 Vdc @ 0.3 $\mu$ A                                                                                |
| Terminal Connector        |                   | AS-8535-000                                                                                                  |

## B881–001 Latched 24 Vdc Input

---

**Purpose**

This chapter describes the functional and physical characteristics of the B881–001 latched 24 Vdc input module.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                            | Page |
|--------------------------------------------------|------|
| B881–001 Latched 24 Vdc Input, Overview          | 512  |
| B881–001 Latched 24 Vdc Input, Field Connections | 514  |
| B881–001 Latched 24 Vdc Input, Specifications    | 515  |
| B881–001 Parameter Configuration                 | 516  |

## B881-001 Latched 24 Vdc Input, Overview

The B881-001 Latched 24 Vdc input module senses and converts input signals from its field circuitry to a logic level used by PLC. The incoming signal causes the module to latch at the occurrence of the on state and may be considered a latching event. The 24 Vdc, true high latched input module is capable of direct connection to any PLC, true high dc output module (at proper voltage).

The following illustration shows the B881-001 Latched 24 Vdc input module simplified block diagram

The latching mechanism exists solely to lockout subsequent incoming signals for the time it takes to communicate to the controller that a latching event occurred, receive an acknowledgement, and reset the latch. The latched input module does not affect the users field circuit, drive the controller or communicate information to it other than the fact that a latching event took place.

Signals on the 16-channel inputs are compared to a reference voltage nominally set to 75% of the group supply voltage. An input signal of 500 s minimum pulse width and equal to or exceeding the reference voltage threshold will cause a latched on state for any given channel. An input signal voltage less than 25% of the group supply voltage will result in a system off state.

When the module senses and latches on the leading edge of the true-high, incoming field signal or data bit (DB), it clocks the D-type flip-flop on the low-to-high transition, in effect, capturing the latching event.

The module's on state is communicated to the controller through shift register (A) and OBS chip via a handshake mechanism. The logic is then returned to the module from the CPU as an inverted signal through shift register (B) where it resets the flip- flop (latch condition) for that channel only. The reset latch is then available for another, low-to-high, event transition. To ensure that the controller has received a latched event, the module actually operates in a user programmed, echoed- data handshake mode. The handshake mechanism requires four to six scans before a new event can be recognized. Total scan time is software-limited to 200 ms maximum and hardware limited to 250 ms maximum. Thus, you should not attempt to record events with a repetition rate greater than one per second unless willing to analyze this actual system and program.

**NOTE:** Reversal of external load polarity will not cause circuit failure as the module is fused to protect its circuitry against overload currents and accidental polarity reversal.

## B881-001 Latched 24 Vdc Input, Field Connections

### Terminal Numbering and Input Functions

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

The following illustration shows the field connections for the unit.

# Chapter 55

## B881–508 125 Vdc Output

---

**Purpose**

This chapter describes the functional and physical characteristics of the B881–508 125 Vdc output module.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                      | Page |
|--------------------------------------------|------|
| B881–508 125 Vdc Output, Overview          | 518  |
| B881–508 125 Vdc Output, Fault Conditions  | 519  |
| B881–508 125 Vdc Output, Field Connections | 520  |
| B881–508 125 Vdc Output, Specifications    | 521  |
| B881–508 Parameter Configuration           | 523  |

## B881-508 125 Vdc Output, Overview

The B881-508 125 Vdc output module has eight isolated outputs. The outputs can serve 125 Vdc voltage relays, pilot lamps, motor starters, solenoids, valves, and any other load rated up to 140 Vdc (the outputs work in the range 5—140 Vdc).

Also, the B881 allows current surges within certain time limits. Internal fault flags report currents greater than 30 A, and currents between 5—30 A for a period greater than 500 ms. This shut down mode can only be cleared by resetting the point. Point control within ms provides fast response in critical situations. The B881-508 conforms to ANSI/IEEE C37.90 1978 duty cycle sequences.

In addition to the normal mode of controlling the outputs, the B881-508 allows the first four points to be independently controlled by external inputs through the field side connector. These external inputs are 24 Vdc active high. When a fault occurs during control by the external inputs, that input must be cycled (turned off) to clear the fault flag.

The following illustration is the B881-508 simplified schematic diagram

## B881-508 125 Vdc Output, Fault Conditions

### Overview

Over-current shutdown, as well as current surges greater than 500 ms are detected by the B881-508. Each point has a fault bit that can be accessed using the programming panel software. Each bit indicates either an over-current (greater than 30 A), or a current surge between 5 -3 A for a period greater than 500 ms. Although the B881-508 is I/O mapped as a 16-point bi-directional module, only the lower order eight inputs and outputs are used; the higher order eight inputs and outputs can not be used. Refer to the illustration below.

The following illustration shows the B881-508 fault flags

## B881-508 125 Vdc Output, Field Connections

### Overview

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

The following illustration shows the B881-508 terminal numbering

**NOTE:** Reverse voltage protection

This module does not provide reverse voltage protection. Check for proper voltage polarity of the output wiring.

## B881-508 125 Vdc Output, Specifications

# Chapter 56

## B882–032 24 Vdc Diagnostic Output and B818 20-28 Vac Discrete Output

---

### Purpose

This chapter describes the functional and physical characteristics of the B882–032 24 Vdc diagnostic output module and the B818 20-28 Vac discrete output module.

### What Is in This Chapter?

This chapter contains the following topics:

| Topic                                                     | Page |
|-----------------------------------------------------------|------|
| B882–032 24 Vdc Diagnostic Output, Overview               | 526  |
| B882–032 24 Vdc Diagnostic Output, Fault Conditions       | 527  |
| B882–032 24 Vdc Diagnostic Output, Field Connections      | 529  |

| B882–032 24 Vdc Diagnostic Output, Specifications         | 535  |
| B818, 20-28 Vac Output, Specifications                    | 537  |
| B882–032 Parameter Configuration                          | 538  |
| B818 Parameter Configuration                              | 539  |

## B882-032 24 Vdc Diagnostic Output, Overview

The B882-032 diagnostic output module provides 32 points that make up four groups of eight outputs. Each group of eight outputs shares an external power supply voltage. The outputs work over the range of 20.0—28.0 Vdc, true high. It is capable of driving 24 Vdc relays, solenoids, pilot lamps, and other loads rated up to 1.0 A.

The B882-032 module also detects field fault conditions and turns the faulted point off for vital applications. The B882-032 diagnostic dc output module can detect open-load, over-current, over-voltage, and over-temperature conditions.

The following illustration is the B882-032 simplified block diagram

The functionality of the diagnostic dc output module can be selected according to the following criteria. It can be a bi-directional module (B882) with 32 discrete outputs and 32 discrete inputs which represent fault flags for each respective output. It can also be a uni-directional module (B818) having 32 discrete outputs without fault flags.

## B882–032 24 Vdc Diagnostic Output, Fault Conditions

### B882 Mode

Open-load, over-current, over-voltage and over-temperature fault conditions are detected by the diagnostic output module.

When an output fault is detected In the B882 mode, the module without controller intervention disarms the faulted output and reports the condition to the controller via discrete input (1x), or input register (3x) points. The point remains disarmed until the user's logic rearms the point by turning the point back on. To turn the point back on the user's logic must turn the point first off and then on.

**NOTE:** If the controller attempts to turn a faulted point back on, there must be a 2 -5 s delay from the time of a fault to the time of cycling the faulted point on. When this delay is not given, the module ignores the change. When the fault point is brought low, the fault indicator clears in the 2-5 s range.

**NOTE:** If field power is lost, the module may detect faults. After field power is reapplied, all faults must be cleared

**NOTE:** Clearing faults prior to restarting

When a fault is detected in either the B882 or B818 mode, the source of the fault should be cleared prior to restarting the point. Failing to clear the source of a fault may result in damage to the

- power source
- driven field-side device
- module

### B818 Mode

When an output fault is detected In the B818 mode, the module without controller intervention disarms the faulted output. Faults are not reported to the controller. To turn the point back on, the user's logic must first turn the point off and then on.

**NOTE:** If the controller attempts to turn a faulted point back on, there must be a 2 - 5 s delay from the time of a fault to the time of cycling the faulted point on. When this delay is not given, the module ignores the change. When the faulted point is brought low, the fault indicator clears in the 2 -5 s range.

**NOTE:** Loss of power.

If field power is lost in the B818 mode, the module may detect faults that are not visible to the controller.

- After field power is reapplied, the points must be turned off and then on for all on states.

## Fault Definitions

| Term         | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Open Load    | When the load current is less than, or equal to 100 mA, the output is turned OFF and the fault flag is set. To prevent the fault flag from being set, a resistor should be placed between the output point and the group return. For example, @ 20 Vdc the minimum load is 200 $\Omega$ , @ 24Vdc the minimum load is 240 $\Omega$ , and @ 28 Vdc the minimum load is 280 $\Omega$ . When the output is already on and the load exceeds the open load trip level for one to one and a half ms, the output is turned OFF, and the fault flag is set. |
| Over Current | When the load current exceeds the over current trip level following the switching of a point from OFF to ON, the output is turned OFF, and the fault flag is set. When the output is already on and the current exceeds the over current trip level for one to one and a half ms, the output is turned OFF, and the fault flag is set.                                                                                                                                                                                                              |

**NOTE:** The over current trip level has a value of 3.5 A or greater. Over current greater than 12 A may cause point failure

| Term             | Definition                                                                                                                                                                                                                                                                                             |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Over Voltage     | If the external voltage supply exceeds the module's rating, the output point turns OFF, and a fault flag may be returned. The point requires cycling after the external supply returns to a safe operating level. The over-voltage trip level has a value greater than 31 Vdc. There is no time delay. |
| Over Temperature | When the junction temperature of the output transistor reaches 140°C or greater, the output is turned OFF, and the fault flag is set.                                                                                                                                                                  |

**NOTE:** the following about unused outputs in a B882

- Unused outputs should not be turned on since their field points are not wired.
- Turning them on will cause an open load fault and the active light will blink.
- The minimum load required is 100 mA.

## B882-032 24 Vdc Diagnostic Output, Field Connections

### Terminal Number and Output Functions

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring. Setting the DIP switch allows selection of bi-directional fault reporting or uni-directional non-fault reporting functionality prior to installation.

The following illustration shows the B882-032 terminal numbering and output connections

## B818, 20-28 Vac Output, Keying and Wiring

### Overview

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

### Terminal Numbering and Output Connections

The following figure shows terminal numbering and output connections for the the B818 module.

|                   |    |    |                    |
|-------------------|----|----|--------------------|
| grp 1 -> output 1 | 1  | 21 | output 17 <- grp 3 |
| output 2          | 2  | 22 | output 18          |
| output 3          | 3  | 23 | output 19          |
| output 4          | 4  | 24 | output 20          |
| +24 Vdc           | 5  | 25 | +24 Vdc            |
| gnd               | 6  | 26 | gnd                |
| output 5          | 7  | 27 | output 21          |
| output 6          | 8  | 28 | output 22          |
| output 7          | 9  | 29 | output 23          |
| output 8          | 10 | 30 | output 24          |
| grp 2 -> output 9 | 11 | 31 | output 25 <- grp 4 |
| output 10         | 12 | 32 | output 26          |
| output 11         | 13 | 33 | output 27          |
| output 12         | 14 | 34 | output 28          |
| +24 Vdc           | 15 | 35 | +24 Vdc            |
| gnd               | 16 | 36 | gnd                |
| output 13         | 17 | 37 | output 29          |
| output 14         | 18 | 38 | output 30          |
| output 15         | 19 | 39 | output 31          |
| output 16         | 20 | 40 | output 32          |

### Mechanical Keying

The following figure shows the keying for the the B818 module.

B882–032 24 Vdc Diagnostic Output, Dip Switch Settings

The four-position dip switch is located on the rear of the module. This switch controls the functionality of the module (bi-directional or uni-directional).

Set switch SW3 for either (B882) bi-directional fault reporting, or (B818) uni- directional non-fault reporting. Refer to the following illustration for switch settings. Also refer to the label located on the left side of the module itself.

The following illustration shows the B882–032 dip switch settings

4 position DIP switch

top of module

|      |       |
|------|-------|
| 0    | 1     |
| on   | off   |
| down | up    |
| left | right |

|          |                                       |
|----------|---------------------------------------|
| switches | functions                             |
| 1 and 2  | not used, keep to left                |
| 3        | module functionality                  |
|          | for bi-directional<br>sw3 = R (B882)  |
|          | for uni-directional<br>sw3 = L (B818) |
| 4        | Not used, keep left                   |

**NOTE:** Selecting the bi-directional module functionality(B882) allows 32 discrete outputs and 32 returned fault flags. Selecting the uni-directional module functionality (B818) allows 32 discrete outputs.

## Module B882–032 24Vdc Diagnostic Output, Quick Start Test

### Quick Start Test Table

This test configures the module as follows: B882 (bi-directional).

The quick-start test is presented in the following table.

| Step | Procedure                                                                                                                                                                                                                   |
|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Set the 4 position dip-switch as follows: (viewing the rear of the module when held vertically):<br>SW1 and SW2 Left Not Used (keep to left)<br>SW3 Right Selects B882 (bi-directional)<br>SW4 Left Not Used (keep to left) |
| 2    | Determine which channel and slot location is being used for this module.                                                                                                                                                    |
| 3    | Wire terminals 5,15, 25, 35 to a +24 Vdc supply, and wire terminals 6,16, 26, 36 to a -24 Vdc Supply on a AS -8535 -000 high density connector.                                                                             |

**NOTE:** Remove the keying tabs on the AS-8535-000 high density connector prior to installing the module.

Quick-start test table, continued.

| Step | Procedure                                                                |
|------|--------------------------------------------------------------------------|
| 4    | Stop the PLC.                                                            |
| 5    | I/O map the module as a B882, registers 30001/30002, 40001/40002 binary. |
| 6    | Start the PLC.                                                           |
| 7    | Write FFFF (hex) into registers 40001 and 40002.                         |

**NOTE:** Ensure that no field devices are connected to these points.

Quick-start test, continued.

| Step | Procedure                                                                                                                                                                                                                                                                                       |
|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 8    | Active light should now be blinking.                                                                                                                                                                                                                                                            |
| 9    | Look at registers 30001 and 30002 in binary format, all bits should be set to a one indicating a returned fault. The fault is present as a result of the open-load condition of the outputs. The module is correctly monitoring its output points and is being read properly by the controller. |

**NOTE:** Active blinking = One or more outputs have sensed a load fault. Active on steady = Points have the minimum load requirements.

### Application Example

The B882 module, with ability to sense its own output points is an excellent choice for critical operations. The example shown below shows ladder logic that allows for detection of point errors. This could ultimately be used to control a system if a critical failure occurred.

The block move shown below moves the contents of registers 30001 and 30002 into 40008 and 40009 where they can be worked. The XOR Block Exclusively OR's the contents of 40001 and 40002 with 40008 and 40009, then places the results of this XOR in 40008 and 40009. This gives a value that can be used in the compare block that compares the contents of 40001 and 40002 to the values in 40008 and 40009. When a mismatch occurs, coil 00001 turns on, which can be tied to an indicator light, or safety circuitry for system protection.

The following illustration provides an example of the application diagram

00001 = mismatch or fault has occurred  
30001 and 40001 = assigned in I/O map  
40007 = pointer for compare block - the pointer  
contains the location of the first  
error bit set in the fault  
register  
40008 and 40009 = exclusive or register value

## B882-032 24 Vdc Diagnostic Output, Specifications

### B882-032 specifications

# Chapter 57

## B882–116 24 Vdc Output

---

**Purpose**

This chapter describes the functional and physical characteristics of the B882–116 24 Vdc output module.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                     | Page |
|-------------------------------------------|------|
| B882–116 24 Vdc Output, Overview          | 542  |
| B882–116 24 Vdc Output, Field Connections | 543  |
| B882–116 24 Vdc Output, Configuration     | 544  |
| B882–116 24 Vdc Output, Switch Settings   | 547  |
| B882–116 24 Vdc Output, Specifications    | 548  |
| B882–116 Parameter Configuration          | 550  |

## B882-116 24 Vdc Output, Overview

### Overview

The B882-116 24 Vdc (16-point) output module monitors field points for both open and short circuit fault conditions. The module is designed for safety applications whereby it monitors essential field wiring.

Two test modes are available: pulse test mode, and no pulse test mode. In no pulse test mode, the module detects open circuits only when the output point is off, and short circuits only when the point is on. Leakage current in the off state is less than 3 mA. Trip current to detect a short circuit is greater than 1 A. In pulse test mode, the module pulses the output to the opposite of the command state to determine the complete status of the output load. Pulse timing is: 500 s opposite state pulse once every second.

**NOTE:** Average currents in output circuits are changed by no more than 0.1% by full test mode.

### Schematic diagram

The following illustration is the B882-116 simplified schematic diagram

This leakage current is actually the 2.5 mA test current source. It cannot be turned off.

## B882-116 24 Vdc Output, Field Connections

### Overview

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

The following illustration shows the B882-116 terminal numbering and output connections

**NOTE:** The dummy load pin is only used to prevent an open circuit fault from being returned from an unused output.

## B882–116 24 Vdc Output, Configuration

This module appears as a B882 module when configured—i.e., the module requires either four 16-bit words—two 3x input registers and two 4x holding registers or 32 discrete 0x outputs and 32 discrete 1xinputs.

The first holding register contains the command state programmed by the user. The input registers contains the faults detected. If an open circuit fault is detected on output point three, then a one is displayed in the 3x register at position three. If a short fault is detected on output point three, then a one is displayed in register  $3x + 1$  at position three. A one indicates a detected fault, whereas a zero indicates normal operation of that output point.

The module uses only three of the four configured 16-bit words. A point that is shorted disables the output current flow. Once a fault is detected the operation follows the following flow chart if the module is in the pulse test mode of operation. If not in pulse test mode, then reported faults are cleared when a command changes it to the opposite state. In either case the detection of a short will force the point off.

**NOTE:** The module will not work correctly with a J810 remote I/O processor.

The B882-116 full fault test mode only flow chart is shown in the illustration below.

Data Registers

|              | MSB | PHYSICAL OUTPUTS | LSB                    |               | MSB | UNUSED OUTPUTS | LSB                    |
|--------------|-----|------------------|------------------------|---------------|-----|----------------|------------------------|
| 40XXX        | 1   | 2 3 4 5 6 7 8    | 9 10 11 12 13 14 15 16 | 40XXX + 1     | 1   | 2 3 4 5 6 7 8  | 9 10 11 12 13 14 15 16 |
| 30XXX        | 1   | 2 3 4 5 6 7 8    | 9 10 11 12 13 14 15 16 | 30XXX + 1     | 1   | 2 3 4 5 6 7 8  | 9 10 11 12 13 14 15 16 |
| OPEN CIRCUIT |     |                  |                        | SHORT CIRCUIT |     |                |                        |

The B882-116 module mode behavior table is shown below.

| Module Mode Behavior                                                                                                                                                                                                                                                                                                          | Partial Test Mode | Full (PULSE) Test Mode |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|------------------------|
| Use with high speed field devices                                                                                                                                                                                                                                                                                             | Yes               | Not recommended        |
| Finds opens when OFF                                                                                                                                                                                                                                                                                                          | Yes               | Yes                    |
| Finds opens when ON                                                                                                                                                                                                                                                                                                           | No                | Yes                    |
| Reaction to OPEN fault*                                                                                                                                                                                                                                                                                                       | No Change         | Point OFF              |
| To clear open fault, close physical fault, then                                                                                                                                                                                                                                                                               | See Note 1        | Write 0                |
| Finds shorts when OFF                                                                                                                                                                                                                                                                                                         | No                | Yes                    |
| Finds shorts when ON                                                                                                                                                                                                                                                                                                          | Yes               | Yes                    |
| Reaction to short fault*                                                                                                                                                                                                                                                                                                      | Point OFF         | Point OFF              |
| To clear short fault, clear physical fault, then                                                                                                                                                                                                                                                                              | See Note 2        | Write 0                |
| *In all cases faults are reported to the PLC via register entries for corresponding point and type of fault(s). In addition, the fault lamp for the corresponding group will blink until fault indication is cleared. Any points with detected short faults will be turned off independent of the command state from the PLC. |                   |                        |
| Note 1: In partial test mode an open fault indication will be cleared by writing a 1 to the output point independent of the actual status of the output wiring.                                                                                                                                                               |                   |                        |
| Note 2: In partial test mode a short fault indication will be cleared by writing a 0 to the output point independent of the actual status of the output wiring.                                                                                                                                                               |                   |                        |

# B882-116 24 Vdc Output, Switch Settings

A two-position dip switch located on the rear of the module is used to select one of two test modes on a group basis. No pulse test mode detects open circuits only when the output is off, and shorts circuits only when the point is on.

Pulse test mode pulses the output to the opposite of the command state to determine the status of the output load. Each individual switch relates to each group of eight output points. For example, DIP switch position #1 when set to on enables pulse test fault sensing for group 1(points 1-8). When a fault is detected the corresponding fault LED flashes independent of the test mode. When the switch is in the off position, no pulse test is performed.

The pulse dip-switch settings for the B882-116 module is shown below.

pulse test switch  
2 position DIP switch  
top of module

|      |       |
|------|-------|
| 1    | 0     |
| on   | off   |
| left | right |
| up   | down  |

| switches | functions                   |
|----------|-----------------------------|
| sw1 = 0  | group 1, pulse test enabled |
| = 1      | group 1, no test            |

|         |                             |
|---------|-----------------------------|
| sw2 = 0 | group 2, pulse test enabled |
| = 1     | group 2, no test            |

**NOTE:** When using binary and BCD format, remember that output 16 is the LSB of word one and word two is ignored by the module.

## B882–116 24 Vdc Output, Specifications

**B882–116 specification table**

|                   |               |
|-------------------|---------------|
| Description       | 24 Vdc output |
| Number of Points  | 16            |
| Number of Groups  | 2             |
| Outputs per Group | 8             |
| Working Voltage   | 19.2-30.0 Vdc |

**NOTE:** The 24 V field supply must be rated to supply output load current +5 A for the module, +5 A surge rating. This 5 A surge rating is required to correctly detect short circuits. Group input power fusing is recommended. The fuse should be rated for expected load current plus 5 A slo-blow.

**NOTE:** Low-voltage

When field supply drops from 24 to 0 V, an output current of up to 15 mA may be generated to points that are OFF. When field supply is below 19.2 V, reported output fault flags may be incorrect.

Module B882–116 specification table, continued

|                           |                                                |
|---------------------------|------------------------------------------------|
| ON State Voltage Drop     | 0.5 Vdc maximum @ 0.5 A                        |
| OFF State Leakage Current | 3.0 mA maximum at 30.0 Vdc                     |
|                           | Maximum allowable load resistance 6 k $\Omega$ |

**NOTE:** 3 mA x 6 k $\Omega$  = 18 V—i.e. leakage current produces enough voltage on a 6 k $\Omega$  load resistor to simulate a valid input signal.

Module B882–116 specification table, continued

|                          |                |                                                             |
|--------------------------|----------------|-------------------------------------------------------------|
| Inrush Current           |                | 1.0 A peak for 0.1 ms at 4 pulses/s while carrying 0.5 A dc |
| Continuous Current       | Maximum        | 0.5 A                                                       |
|                          | Maximum/group  | 4.0 A                                                       |
|                          | Maximum/module | 8.0 A                                                       |
| Maximum Load Current     |                | 10 mA                                                       |
| Maximum Load Inductance  |                | 0.5 H @ 0.5 A, 4 Hz switching                               |
| Maximum Load Capacitance |                | 4 F @ 4 Hz maximum switching frequency                      |
| Power Required           | +5 V           | 350 mA maximum all outputs ON                               |
|                          | +4.3 V         | 10 mA                                                       |
|                          | -5 V           | 0 mA (not used)                                             |
| Terminal Connector       |                | AS-8535-000                                                 |

# Chapter 58

## B883–001 High Speed Counter

---

**Purpose**

This chapter describes the functional and physical characteristics of the B883-001 high speed counter module.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                          | Page |
|------------------------------------------------|------|
| B883–001 High Speed Counter, Overview          | 552  |
| B883–001 High Speed Counter, Keying and Wiring | 553  |
| B883–001 High Speed Counter, Specifications    | 555  |
| B883–001 Parameter Configuration               | 557  |

## B883-001 High Speed Counter, Overview

### Overview

The B883-001 high speed counter module consists of two separate and independent counters and associated logic, and controls up to three outputs. After being configured, the module can operate independently of the PC and react to external events faster than the PC scan time. The module counters have the following characteristic:

Counter #1 has bi-directional (up/down) count capability and has two inputs, two set points, a programmable maximum count, and two outputs. Counter 1 will also accept input from a quadrature type device such as an encoder.

Counter #2 is an up counter and has one input, a programmable maximum count, and one output.

Both counters accept pulsed inputs of 0 to 5, 0 to 12, or 0 to 24 Vdc at frequencies up to 50 KHz. the B883 options are selected by commands from the PC and by terminal wiring.

Counter #1 has three modes of operation. Counter #2 can accept input either from an external source or from one of two internal clocks. Both counters can be configured to operate in a wide variety of applications (refer to the section on programming the B883)

# B883–001 High Speed Counter, Keying and Wiring

## Overview

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

## Terminal Numbering and Output Connections

The following diagram shows terminal numbering and output connections for the the B883-001 module.

|                       |    |
|-----------------------|----|
| counter 2 output —    | 10 |
| return —              | 9  |
| counter 2 enable —    | 8  |
| counter 2 reset —     | 7  |
| counter 2 input —     | 6  |
| counter 2 frequency — | 5  |
| return —              | 4  |
| counter 1 output 2 —  | 3  |
| counter 1 output 1 —  | 2  |
| return —              | 1  |
| counter 1 enable —    | 10 |
| counter 1 marker —    | 9  |
| counter 1 preset —    | 8  |
| input select —        | 7  |
| counter 1 input B —   | 6  |
| counter 1 input A —   | 5  |
| counter 1 frequency — | 4  |
| return —              | 3  |
| voltage reference —   | 2  |
| return —              | 1  |

**Mechanical Keying**

The following figure shows the keying for the the B883-001 module.

## B883-001 High Speed Counter, Specifications

### Specification Table

The following table provides the specifications for the unit.

| B883-001 Specifications     |                           |                                                                          |
|-----------------------------|---------------------------|--------------------------------------------------------------------------|
| Number of Counters          |                           | 2                                                                        |
| Number of Auxiliary Inputs  |                           | 6                                                                        |
| Number of Outputs           |                           | 3                                                                        |
| Operating voltage           |                           | 5-24 Vdc                                                                 |
| Overvoltage                 |                           | Up to 30 Vdc                                                             |
| Power Required              | +5 V                      | 677 mA                                                                   |
|                             | +4.3 V                    | 0 mA                                                                     |
|                             | -5 V                      | 0 mA                                                                     |
| Voltage Range               | 5 Vdc                     | 2.4 to 5.5 Vdc                                                           |
|                             | 12 Vdc                    | 6 to 16 Vdc                                                              |
|                             | 24 Vdc                    | 12 to 32 Vdc                                                             |
| Transition                  | 0 to 1                    | 1 to 0                                                                   |
|                             | 5 Vdc                     | 2.4 Vdc                                                                  |
|                             | 12 Vdc                    | 5.6 Vdc                                                                  |
|                             | 24 Vdc                    | 11.2 Vdc                                                                 |
| Max Count Frequency         |                           | 50 kHz                                                                   |
| Ramp Time                   |                           | 7 V per sec                                                              |
| Topology: 2 counters/module | Counter 1                 | bidirectional up/down                                                    |
|                             | Counter 2                 | unidirectional up                                                        |
| Visual indicators           | 1 LED/output              | "on" when output is on                                                   |
|                             | 1 "field power" indicator | "on" when field power is present                                         |
|                             | 1 "active" indicator      | "on" when good communication with PC                                     |
|                             | 1 "PWR" indicator         | "on" when backplane power applied                                        |

# Chapter 59

## B883–101 and B883–111 CAM

---

**Purpose**

This chapter describes the functional and physical characteristics of the B883-101 and B883-111CAM modules.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                         | Page |
|-----------------------------------------------|------|
| B883-101 and B883-111 CAM, Overview           | 560  |
| B883–101 and B883–111 CAM, Keying and Wiring  | 561  |
| B883–101 and B883–111 CAM, Specifications     | 562  |
| B883–101 and B883–111 Parameter Configuration | 563  |

## B883-101 and B883-111 CAM, Overview

### Overview

The B883-111 CAM module with velocity compensation and the B883-101 CAM module are 800 series input/output (I/O) modules with added microprocessor control capabilities. These modules are used to automate the operation of metal shaping power presses for any mass production industry such as motor vehicle manufacture and assembly. Both models of the CAM module are physically indistinguishable and will be discussed as a single unit.

The CAM module receives a twelve-bit (plus control) parallel position code from an encoder. The module then transmits an eight-bit parallel control code to its discrete outputs based upon the received position data.

Operating instructions in command form are loaded into the module from a programmable controller by way of the I/O system. After the commands are loaded, position codes received by the module are processed and outputted by the CAM module at a 4.000 Hertz rate. This speed is in excess of the PC's scan rate. A total of 16 output intervals may be defined and distributed at random among eight outputs.

CAM module inputs will be accepted in binary, binary coded decimal (BCD) or Gray code.

If your application requires velocity compensation, choose the B883-111 module. The B883-111 module compensates for changes in velocity.

## B883–101 and B883–111 CAM, Keying and Wiring

### Overview

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

### Terminal Numbering and Output Connections

The following diagram shows terminal numbering and output connections for the the B883-101 and B883-111 modules.

|                |    |    |                |
|----------------|----|----|----------------|
| Power Common — | 1  | 11 | — Field Power  |
| O/P 1 —        | 2  | 12 | — NC           |
| O/P 2 —        | 3  | 13 | — NC           |
| O/P 3 —        | 4  | 14 | — NC           |
| O/P 4 —        | 5  | 15 | — NC           |
| NC —           | 6  | 16 | — O/P 5        |
| NC —           | 7  | 17 | — O/P 6        |
| NC —           | 8  | 18 | — O/P 7        |
| NC —           | 9  | 19 | — O/P 8        |
| Field Power —  | 10 | 20 | — Power Common |

### Mechanical Keying

The following figure shows the keying for the the B883-101 and B883-111 modules.

**B883–101 and B883–111 CAM, Specifications**

**Specification Table**

The following table provides the specifications for the unit.

| B883-101 & B883-111 Specifications |                    |                                                                            |
|------------------------------------|--------------------|----------------------------------------------------------------------------|
| Number of Inputs                   |                    | 12                                                                         |
| Number of Outputs                  |                    | 8                                                                          |
| Supply Voltage                     |                    | Max. 7 Vdc                                                                 |
| Operating Voltage                  |                    | 20.4 - 28.8 Vdc 25 mA - 1.9 A                                              |
| Maximum velocity                   |                    | 4000 counts/sec                                                            |
| Topology                           |                    | 8 positive true saturated switches per module (12 Bit TTL/CMOS input)      |
| Power required                     | + 5 V              | 1000 mA                                                                    |
|                                    | + 4.3 V            | 0 mA                                                                       |
|                                    | - 5 V              | 0 mA                                                                       |
| Visual indicators                  | 1 active indicator | "on" when good communication with PC                                       |
|                                    | 1 run indicator    | "on" when in run mode                                                      |
| Reference Type Inputs              |                    | Mapped as 48 bits input<br>1x<br>or<br>Mapped as 3 registers input<br>3x   |

# Chapter 60

## B883–200 Thermocouple Input Module

---

**Purpose**

This chapter describes the functional and physical characteristics of the B883-200 thermocouple input module.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                          | Page |

## B883–200 Thermocouple Input, Overview

### Overview

The B883-200 thermocouple input module is a smart I/O module that multiplexes up to ten thermocouples into three consecutive input registers of the control system.

Each B883-200 module provides reference junction temperature compensation, open circuit detection, and linearization for ten thermocouples. Also built-in are self-calibration, internal diagnostics, and 800-series bus diagnostics.

Any mix of type B, E, J, K, R, S, T or N thermocouple operations or simple –20 to +80 mV input operations may be set by the user under program control.

For the thermocouple inputs, the PLC can access individual temperature readings in degrees Centigrade, Fahrenheit or in compensated millivolts. Each time the PLC scans the B883-200 module, it receives the specified temperature or millivolt reading along with open-circuit and module health data. The thermocouple wire is terminated on a special isothermal connector assembly on the housing. Each B883-200 module uses three consecutive input registers and three output registers.

## B883–200 Thermocouple Input, Keying and Wiring

### Overview

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

### Terminal Numbering and Output Connections

The following diagram shows terminal numbering and output connections for the the B883-200 module.

# Chapter 61

## B883–201 RTD Input

---

### Purpose

This chapter describes the functional and physical characteristics of the B883-201 RTD input module.

### What Is in This Chapter?

This chapter contains the following topics:

| Topic                                 | Page |
|---------------------------------------|------|
| B883–201 RTD Input, Overview          | 572  |
| B883–201 RTD Input, Keying and Wiring | 573  |
| B883–201 RTD Input, Specifications    | 575  |
| B883–201 Parameter Configuration      | 576  |

## B883–201 RTD Input, Overview

### Overview

The B883-201 resistance temperature detector (RTD) module is a smart I/O module that multiplexes up to eight two- or three-wire RTDs into three consecutive input registers of a control system.

Each B883-201 module provides linearization for any mix of 8 RTDs. Also built-in are self-calibration, internal diagnostics, and 800-series bus diagnostics.

American standard platinum, European standard platinum per DIN, or linear resistance input can be selected by the user under program control.

When an RTD is selected, the PLC can access each individual temperature reading in Centigrade, Fahrenheit or in compensated millivolts. Each time the PLC scans the B883-201 module, it receives the specified temperature or millivolt reading along with open-circuit and module health data.

Each B883-201 uses three consecutive input registers and three output registers. These registers are assigned to the same slot within the channel.

## B883–201 RTD Input, Keying and Wiring

### Overview

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

### Terminal Numbering and Output Connections

The following diagram shows terminal numbering and output connections for the the B883-201 module.

# Chapter 62

## B884–002 PID

---

**Purpose**

This chapter describes the functional and physical characteristics of the B884-002 PID module.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                   | Page |
|-----------------------------------------|------|
| B884–002 PID, Overview                  | 578  |
| B884–002 PID Control, Keying and Wiring | 579  |
| B884–002 PID Control, Specifications    | 581  |
| B884–002 Parameter Configuration        | 582  |

## B884-002 PID, Overview

### Overview

The B884-002 PID module provides two completely independent and separate Proportional Integral Derivative (PID) loops. You can configure the PID loops for control strategies including open loop, closed loop, PID, PID on error squared and cascade control.

You configure the PID module using a configuration program (Part #SW-BDD-3DA) on an IBM or compatible personal computer. You can download the data either through the PLC or directly to the modules, where it is stored in a non-volatile EEPROM memory.

To ensure the highest accuracy and reliability, the module has fully floating, isolated and protected inputs and outputs. The module has seven independently configured analog inputs (4 voltage/current, 2 thermocouple, 1 frequency), two analog outputs, two discrete inputs and two discrete outputs. Each loop is assigned two voltage and one thermocouple inputs.

There is no need for any analog adjustments such as trimpots for zero, offset, or span, which results in superior accuracy, stability and reliability.

## B884-002 PID Control, Keying and Wiring

### Overview

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

### Terminal Numbering and Output Connections

The following diagram shows terminal numbering and output connections for the the B884-002 module.

# Chapter 63

## B885–002 ASCII / BASIC

---

**Purpose**

This chapter describes the functional and physical characteristics of the B885-002 ASCII / BASIC module.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                     | Page |
|-------------------------------------------|------|
| B885–002 ASCII / BASIC, Overview          | 584  |
| B885–002 ASCII / BASIC, Keying and Wiring | 585  |
| B885–002 ASCII / BASIC, Specifications    | 587  |
| B885–002 Parameter Configuration          | 588  |

## B885-002 ASCII / BASIC, Overview

### Overview

The B885-002 ASCII / BASIC module runs user-written BASIC programs independently of the controller's memory logic and scan. It also performs READ and WRITE commands to and from serial devices connected to either of the module's two RS 232/422 ports (jumper selectable). In addition, its real-time clock/calendar allows the module to run a BASIC program or flag and return a value to the PLC at a user specified date and time.

The module provides report generation, interactive operator interface, high level math, peripheral communication and data storage.

Using a dumb terminal or an IBM personal computer with Emulator Software (Part # SW-E885-1DA), you program the module's 53K of user memory. If you need more memory, you may provide an additional 32K of user EPROM. You can designate part of the memory as retentive variable memory to store formulas or other process parameters.

# B885–002 ASCII / BASIC, Keying and Wiring

## Overview

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

## Terminal Numbering and Output Connections

The following diagram shows terminal numbering and output connections for the the B885-002 module.

|    |   |     |                     |
|----|---|-----|---------------------|
| 1  | — | N/A | Protective GND      |
| 2  | — | OUT | RS232 Send          |
| 3  | — | IN  | RS232 Receive       |
| 4  | — | OUT | RS232 RTS           |
| 5  | — | IN  | RS232 CTS           |
| 6  | — | IN  | RS232 DSR           |
| 7  | — | N/A | RS232 & RS422       |
| 8  | — | CD* | Common              |
| 12 | — | OUT | RS422 RTS high      |
| 13 | — | OUT | RS422 RTS low       |
| 14 | — | OUT | RS422 SD high       |
| 15 | — | OUT | RS422 SD low        |
| 16 | — | IN  | RS422 CTS low       |
| 17 | — | IN  | RS422 CTS high      |
| 18 | — | OUT | +5 V                |
| 19 | — | IN  | Select Input RS 422 |
| 20 | — | OUT | RS232 DTR           |
| 21 | — | IN  | RS422 RD high       |
| 25 | — | IN  | RS422 RD low        |

**Mechanical Keying**

The following figure shows the keying for the the B885-002 module.

# Chapter 64

## Module B885-1xx Motion Modules

---

**Purpose**

This chapter describes the functional and physical characteristics of the B885-1xx motion modules.

**What Is in This Chapter?**

This chapter contains the following topics:

| Topic                                              | Page |
|----------------------------------------------------|------|
| Module B885-1xx, Motion Modules, overview          | 590  |
| Module B885-1xx, Motion Modules, Keying and Wiring | 591  |
| Module B885-1xx, Motion Modules, Specifications    | 593  |
| Module B885-1xx Parameter Configuration            | 594  |

## Module B885-1xx, Motion Modules, overview

### Overview

B885-1xx motion modules are high performance, single axis servo motion controllers contained in a single-width 800-Series I/O module. They are designed to plug directly into the I/O rack of the 984 PLC, although they are capable of standalone operation.

The modules use Schneider Automation's patented Direct Numerical Processing (DNP) technology. Advanced digital brushless motion control eliminates potentiometer adjustments and analog velocity loops for optimal control.

The B885-100 / B885-101 module uses a resolver to provide feedback for the position, velocity, and commutation of the motor. Essentially, a rotary brushless transformer that provides absolute position information to the motion module, the resolver gives the module a high degree of noise immunity.

The B885-110 / B885-111 module additionally has two quadrature encoder interfaces for extra position and velocity feedback.

Control communication interface to the B885-1xx modules can be either through the 800 I/O system backplane or the Modbus/RS-232 serial port. The module is designed to work directly with the Cyberline 1000 series brushless servo amplifiers as well as those of third-party vendors.

The PLC communicates with the motion modules through six input and six output registers with the control instructions providing a powerful, smooth and fast link between the two. Adjustable command buffering and direct register to function bits provide added communication speed for high response functions.

Motion programs, developed using MMDS, are either stored directly in the flash memory of the motion module or as registers in the PLC. The Motion Development Software (MMDS) is an on-line/ off-line, menu driven package (Part # SW-MMDS-1DB) for the IBM-AT or compatible computers. It enables the user to set up, program, operate and diagnose operation of the motion module. The program and file manipulation features are a versatile system for application management. The MMDS communicates via a computer serial port to the Modbus port on the motion module.

# Module B885-1xx, Motion Modules, Keying and Wiring

## Overview

User connections are made to a standard screw terminal strip. The rigid wiring system permits module insertion or removal without disturbing the wiring.

## Terminal Numbering and Output Connections

The following diagram shows terminal numbering and output connections for the B885-1xx module.

|            |    |    |              |
|------------|----|----|--------------|
| FLT +      | 1  | 19 | 24VDC        |
| COM        | 2  | 20 | RTN          |
| EN NO      | 3  | 21 | Out1         |
| EN NC      | 4  | 22 | Out2         |
| EN C       | 5  | 23 | Out3         |
| PH A       | 6  | 24 | RTN          |
| PH B       | 7  | 25 | Inpt1        |
| PH C       | 8  | 26 | Inpt2        |
| Com        | 9  | 27 | Inpt3        |
| N/U        | 10 | 28 | RTN          |
| (TB4) Ref+ | 11 | 29 | Jog+ (Inpt4) |
| Ref -      | 12 | 30 | Jog- (Inpt5) |
| Sin +      | 13 | 31 | Inpt6        |
| Sin -      | 14 | 32 | Inpt7        |
| COS +      | 15 | 33 | RTN          |
| COS -      | 16 | 34 | AOut (TB3)   |
| COM        | 17 | 35 | ACom         |
|            | 18 | 36 | Aln          |

**Mechanical Keying**

The following figure shows the keying for the B885-1xx module.

## Module B885-1xx, Motion Modules, Specifications

### Specification Table

The following table provides the specifications for the unit.

| B885-1••Specifications |            |                                                                            |
|------------------------|------------|----------------------------------------------------------------------------|
| Voltage Range          |            | 24 Vdc                                                                     |

# Chapter 65

## Modules 3240 4 Axis and 3220 8 Axis Servo Motion Control Module

---

### Purpose

This chapter describes the functional and physical characteristics of the 3240 4 axis and 3220 8 axis servo motion control module.

### What Is in This Chapter?

This chapter contains the following topics:

| Topic                                                         | Page |
|---------------------------------------------------------------|------|
| Module 3240 4 Axis Servo Motion Control Module, Specification | 596  |
| Module 3220 8 Axis Servo Motion Control Module, Specification | 597  |

# Module 3240 4 Axis Servo Motion Control Module, Specification

## Specification Table

The 3240 motion control module is used for program applications which require control of two to four axes of motion.

The following table provides the specification for the unit.

| 3240 Motion Control Module Specifications     |                                                                                                                                                        |
|-----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| Positioning accuracy<br>Typical<br>Worst Case |                                                                                                                                                        |
|                                               | +/- 5 arc minutes                                                                                                                                      |
|                                               | +/- 9 arc minutes                                                                                                                                      |
| Position repeatability                        | +/- 3 arc minutes                                                                                                                                      |
| Absolute positioning range                    | > +/- 130,000 revolutions                                                                                                                              |
| Position resolution range                     | 10 to 16,384 per revolution                                                                                                                            |

## Module 3220 8 Axis Servo Motion Control Module, Specification

### Specification Table

The 3220 motion control module is used for program applications which require control of one to eight axes of motion. It has advanced motion diagnostics.

The following table provides the specification for the unit.

| 3220 Motion Control Module Specifications     |                                                                                                                                    |
|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| Positioning accuracy<br>Typical<br>Worst Case |                                                                                                                                    |
|                                               | +/- 4 arc minutes                                                                                                                  |
|                                               | +/- 8 arc minutes                                                                                                                  |
| Position repeatability                        | +/- 2 arc minutes                                                                                                                  |
| Absolute positioning range                    | > +/- 130,000 revolutions                                                                                                          |
| Position resolution range                     | 10 to 16,384 per revolution                                                                                                        |
| Speed resolution range                        | > 1,000,000 to 1; software dependent                                                                                               |
| No. Axes supported                            | 8                                                                                                                                  |

### Module 410 Single Axis Motion Control Module, Specification

#### General Characteristics

The 410 combines logic, I/O control, motion control, and drive in a single unit. It provides a complete set of control functions, math, conditionals and subroutines for programs up to 500 steps.

There are 5 models:

| Model | Cont. O/P | Peak O/P | Cont. O/P | Peak O/P |
|-------|-----------|----------|-----------|----------|
| 410-0 | 5A AC     | 7A AC    | 5A DC     | 10A DC   |
| 410-1 | 10A AC    | 14A AC   | 10A DC    | 20A DC   |
| 410-2 | 20A AC    | 28A AC   | 20A DC    | 40A DC   |
| 410-3 | 30A AC    | 42A AC   | 30A DC    | 60A DC   |
| 410-4 | 60A AC    | 84A AC   | 60A DC    | 120A DC  |

#### Specification Table

The following table provides the specification for the unit.

| 410 Motion Control, Specifications                       |                                                                                                   |
|----------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| Positioning accuracy normalized<br>Typical<br>Worst Case |                                                                                                   |
|                                                          | +/- 8 arc minutes                                                                                 |
|                                                          | +/- 12 arc minutes                                                                                |
| Position repeatability                                   | +/- 4 arc minutes                                                                                 |
| Absolute positioning range                               | > +/- 130,000 revolutions                                                                         |
| Position resolution range                                | 10 to 16,384 per revolution                                                                       |
| Speed resolution range                                   | > 1,000,000 to 1                                                                                  |
| Servo characteristics                                    | set in software                                                                                   |
| Feedback                                                 | "T" type brushless resolver for position, velocity, commutation                                   |
| Digital input types                                      | +/- End-of-travel and home limits, inhibit input, 4 user inputs 10-27 Vdc, 6.6k nominal impedance |
| Digital output types                                     | Fault output, 4 user defined outputs 27 Vdc, open collector, 100 mA per channel                   |

# Part IV

## 800 Series I/O Modules Configuration

---

**At a Glance**

This part provides a detailed description of how to configure Control Expert to include the 800 series modules in a system.

**What Is in This Part?**

This part contains the following chapters:

| Chapter | Chapter Name                                                | Page |
|---------|-------------------------------------------------------------|------|
| 67      | 800 Series I/O Modules Configuration                        | 603  |
| 68      | 800 Series I/O Modules with Control Expert Addressing Modes | 605  |

---

# Chapter 67

## 800 Series I/O Modules Configuration

---

### Configuring 800 Series I/O Modules with Control Expert

#### Introduction

To configure a series 800 I/O module under Control Expert, configure a RIO drop, which contains I/O modules. The following description gives you step by step instructions to implement and configure series 800 I/O modules with Control Expert system.

#### Adding a RIO Bus

To add an RIO Bus

| Step | Action                                                                        | Comment                                                                                                                              |
|------|-------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| 1    | From the Project Browser "Configuration" tree, open the local rack            | The graphical representation of the local rack opens.                                                                                |
| 2    | Double-click an empty slot in the rack where you want to place your RIO head. | The "New Device" dialog window opens.                                                                                                |
| 3    | Open the "Communication" tree and double-click on the 140 CRP 93X 00 module.  | The RIO head module is added to the local rack.<br>In the Project Browser "Configuration" tree the "RIO bus" is automatically added. |

#### Adding a 800 I/O Drop

To add an 800 I/O Drop

| Step | Action                                                                                                                                | Comment                                                                        |
|------|---------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------|
| 1    | From the Project Browser "Configuration" tree, double-click the "RIO bus"                                                             | The graphical representation of the RIO bus opens.                             |
| 2    | Double-click an empty node of the RIO bus                                                                                             | The "New Device" dialog window opens.                                          |
| 3    | In the "New Device" dialog window, select both the appropriate rack from the "800 IO Drop" tree and a "Drop-end communicator" module. | A new 800 I/O rack containing a communication module is added to your RIO bus. |
| 4    | Click OK.                                                                                                                             |                                                                                |

Adding a 800 I/O Module

To add a new I/O module to your RIO Drop

| Step | Action                                                                                                                   | Comment                               |
|------|--------------------------------------------------------------------------------------------------------------------------|---------------------------------------|
| 1    | From the "RIO Bus" configuration window, double-click an empty slot in the rack where you want to place your I/O module. | The "New Device" dialog window opens. |
| 2    | From the "New Device" window, open the list of analog or discrete modules and double-click on the appropriate module.    | The I/O module is added to the rack.  |

Configuring a Module

To configure an I/O module,

1. Double click on the module.

When the configuration window opens, enter the following parameters:

| Parameter Name           | Description                                                                                                                              |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| MAPPING                  | Define whether access is either <ol style="list-style-type: none"><li>1. Bits (%I-1x, %M-0x)</li><li>2. Words (%IW-3x, %MW-4x)</li></ol> |
| INPUTS STARTING ADDRESS  | In the address type, as defined by the MAPPING parameter, enter the starting address of the input data.                                  |
| INPUTS ENDING ADDRESS    | Parameter automatically calculated by the system.                                                                                        |
| OUTPUTS STARTING ADDRESS | In the address type, as defined by the MAPPING parameter, enter the starting address of the output data.                                 |
| OUTPUTS ENDING ADDRESS   | Parameter automatically calculated by the system.                                                                                        |
| OUTPUT TYPE              | Define whether data value is interpreted either as <ol style="list-style-type: none"><li>1. BINARY</li><li>2. BCD</li></ol>              |

Converting Direct Address Notation

Use the following table to convert 984LL notation to IEC notation.

| Outputs and Inputs | 984LL Notation Register Addresses | IEC Notation          |                  |               |
|--------------------|-----------------------------------|-----------------------|------------------|---------------|
|                    |                                   | System Bits and Words | Memory Addresses | I/O Addresses |
| output             | 0x                                | System Bit            | %Mx              | %Qx           |
| input              | 1x                                | System Bit            | %Ix              | %Ix           |
| input              | 3x                                | System Word           | %IWx             | %IWx          |
| output             | 4x                                | System Word           | %MWx             | %QWx          |

---

# Chapter 68

## 800 Series I/O Modules with Control Expert Addressing Modes

---

### Purpose

To allow an easy transition from the register addressing (3x, 4x) of 984LL to the IEC addressing modes used in Control Expert, this chapter describes

- Flat Addressing
- Topological Addressing

**NOTE:** Topological addresses overlapping (%IW<sub>r</sub>.m.c) is not supported by Quantum application, use flat addressing (%IW<sub>x</sub>) when memory overlapping control is needed.

### What Is in This Chapter?

This chapter contains the following topics:

| Topic                                                             | Page |
|-------------------------------------------------------------------|------|
| Flat Addressing—800 Series I/O Modules                            | 606  |
| Topological Addressing—800 Series I/O Modules with Control Expert | 607  |
| Addressing Example—800 Series I/O Modules with Control Expert     | 608  |

## Flat Addressing—800 Series I/O Modules

### Introduction

800 series I/O modules follow a system of flat address mapping in Control Expert. To work properly, each module requires a determinate number of bits and/or words. The IEC addressing system is equivalent to the 984LL register addressing. Use the following assignments:

- 0x is now %Mx
- 1x is now %Ix
- 3x is now %IWx
- 4x is now %MWx

The following table shows the relationship between 984LL notation and IEC notation.

| Outputs and Inputs | 984LL Notation<br>Register Addresses | IEC Notation          |                  |               |
|--------------------|--------------------------------------|-----------------------|------------------|---------------|
|                    |                                      | System Bits and Words | Memory Addresses | I/O Addresses |
| output             | 0x                                   | System Bit            | %Mx              | %Qx           |
| input              | 1x                                   | System Bit            | %Ix              | %Ix           |
| input              | 3x                                   | System Word           | %IWx             | %IWx          |
| output             | 4x                                   | System Word           | %MWx             | %QWx          |

To access the I/O data of a module,

| Step | Action                                               |
|------|------------------------------------------------------|
| 1    | Enter the address range in the configuration screen. |

### Examples

The following examples show the relationship between 984LL register addressing and IEC addressing:

000001 is now %M1

100101 is now %I101

301024 is now %IW1024

400010 is now %MW10

## Topological Addressing—800 Series I/O Modules with Control Expert

### Accessing I/O Data Values

Use topological addressing to access I/O data items. Identify the topological location of the module within an 800 series I/O module with Control Expert using the following notation:

```
%<Exchangetype><Objecttype>[\b.e\]r.m.c[.rank]
```

where:

- **b** = bus
- **e** = equipment (drop)
- **r** = rack
- **m** = module slot
- **c** = channel

**NOTE:** When addressing,

1. The [b.e] defaults to \1.1\ in a local rack and does not need to be specified.
2. The rank is an index used to identify different properties of an object with the same data type (value, warning level, error level).
3. The rank numbering is zero-based, and if the rank is zero, omit the entry.

For detailed information on I/O variables, please refer to the *EcoStruxure™ Control Expert, Program Languages and Structure, Reference Manual*.

### Reading Values: An Example

| To read                                                                                               | Action                     |
|-------------------------------------------------------------------------------------------------------|----------------------------|
| input value (rank = 0) from channel 7 of an analog module located in slot 6 of a local rack:          | Enter<br>%IW1.6.7[.0]      |
| input value (rank = 0) from channel 7 of an analog module located in slot 6 of drop 3 of RIO bus 2:   | Enter<br>%IW\2.3\1.6.7[.0] |
| 'out of range' value (rank = 1) from channel 7 of an analog module located in slot 6 of a local rack: | Enter<br>%I1.6.7.1[.0]     |

## Addressing Example—800 Series I/O Modules with Control Expert

### Analog Module

The following example compares the 2 possible addressing modes. An 8-channel analog input module B875-200 with the following configuration data is used:

- mounted in slot 5 of the RIO rack #3 located at drop 4 on bus 2
- starting input address is 201 (input word %IW201)
- end input address is 208 (input word %IW208)

To access the I/O data from the module you can use the following syntax:

| Module data | Flat addressing | Topological addressing | Concept addressing |
|-------------|-----------------|------------------------|--------------------|
| Channel 3   | %IW203          | %IW\2.4\3.5.3          | 300203             |

For comparison, the register addressing as used with concept is added in the last column.

### Discrete Module

The following example compares the 2 possible addressing modes. An 32-channel discrete output module B838-032 with the following configuration data is used:

- mounted in slot 4 of the RIO rack #3 located at drop 4 on bus 2
- starting output address is 101 (output word %MW101)
- end output address is 102 (output word %MW102)

To access the I/O data from the module you can use the following syntax:

| Module data | Flat addressing | Topological addressing | Concept addressing |
|-------------|-----------------|------------------------|--------------------|
| Output 5    | %MW101.11       | %QW\2.4\3.4.1.1.11     | 300101             |
| Output17    | %MW102.15       | %QW\2.4\3.4.1.2.15     | 300102             |

For comparison, the register addressing as used with concept is added in the last column. As concept does not support direct addressing of a bit in a word, the bit extraction has to be performed in the user program.

The same configuration as before but data mapped into bits:

- mounted in slot 4 of the RIO rack #3 located at drop 4 on bus 2
- starting output address is 1 (output %M1)
- end output address is 32 (output %M32)

To access the I/O data from the module you can use the following syntax:

| Module data | Flat addressing | Topological addressing | Concept addressing |
|-------------|-----------------|------------------------|--------------------|
| Output 5    | %M5             | %Q\2.4\3.4.5           | 000005             |
| Output17    | %M17            | %Q\2.4\3.4.17          | 000017             |

For comparison, the register addressing as used with Concept is added in the last column.

---

# Appendices

---

## Overview

The materials in this appendix describe:

- the replacement of existing 800 remote I/O adapters with Schneider Electric ASP890300 remote I/O processor
- procedures for the reflash of executive software in the Schneider Electric ASP890300 remote I/O processor
- installation requirements for 800 series I/O modules bearing the CE mark

## What Is in This Appendix?

The appendix contains the following chapters:

| Chapter | Chapter Name                                         | Page |
|---------|------------------------------------------------------|------|
| A       | ASP890300 Universal Hardware Upgrade Guide           | 613  |
| B       | ASP890300 Executive Software Reflash                 | 627  |

## ASP890300 Universal Hardware Upgrade Guide

---

### Purpose

The purpose of this chapter is to assist users in the physical replacement of existing 800 I/O Remote Adapters with the Schneider Electric ASP890300 Remote I/O Processor.

Existing Remote I/O system installations may utilize obsolete taps (MA-0185-000, Revision B or lower). The minimum revision taps that should be used are Revision C or higher. Any revision MA-0185-100 tap may be used. Refer to Section 3.6 of the *Remote I/O Cable System Planning and Installation Guide* (890 USE 101 00) for more information.

### What Is in This Chapter?

This chapter contains the following topics:

| Topic                                                         | Page |
|---------------------------------------------------------------|------|
| Replacement of AS-P89X-000 Adapters                           | 614  |
| Replacement of AS-J89X-X0X Adapters                           | 615  |
| Replacement of AS-J81X-000 Adapters                           | 617  |
| Replacement of Slot Mount PLCs                                | 619  |
| Backplane Interconnection Diagrams                            | 620  |
| ASP89X Capacity Information                                   | 622  |
| Power Supply Capacities in Remote Drop Secondary Applications | 623  |
| I/O Module Current Requirements                               | 624  |

## Replacement of AS-P89X-000 Adapters

### Overview

The ASP890300 is backplane compatible with AS-P890-000 and AS-P892-000 installations. The AC power and ASCII port connections are different.

### AC Power Connector Rewiring

Rewiring is required to accommodate a 5 terminal connector that includes a 115/230 VAC jumper selection option as opposed to the switch selectable option in the original units. Rewiring requires a small slotted screwdriver.

## DANGER

### ELECTRIC SHOCK

Connect the module grounding terminal to the protective ground, using a green/yellow wire.

**Failure to follow these instructions will result in death or serious injury.**

### ASCII Port Connector

Pin 1 on the P892 is chassis ground. Pin 1 on the ASP890300 ASCII port connector is not used. The connector shell is chassis ground.

## Replacement of AS-J89X-X0X Adapters

### Overview

The ASP890300 is **not physically compatible** if installations use the following adapter models.

|             |             |
|-------------|-------------|
| AS-J890-001 | AS-J892-001 |
| AS-J890-002 | AS-J892-002 |
| AS-J890-101 | AS-J892-101 |
| AS-J890-102 | AS-J892-102 |

In these installations, you will need to:

- replace the primary backplanes ( housings)
- perform power calculations to determine if additional supplies are needed (see *I/O Module Current Requirements*, [page 624](#))
- consider backplane interconnection cables
- review ASCII port and coaxial cable connection

### Primary Backplane Replacement

ASP890300 modules are compatible with:

- AS-H810-208 (10", ASP890300 plus three I/O modules)\*
- AS-H810-209 (10", ASP890300 plus three I/O modules)\*
- AS-H819-209 (19", ASP890300 plus six I/O modules)
- AS-H827-209 (27", ASP890300 plus ten I/O modules)

\*Repair/service exchange only.

### Power Considerations

If the primary backplane power requirements exceed the ASP890300 capabilities, enough I/O modules must be removed from the primary backplane to bring the current load within specified limits. In this case, an additional backplane and power supply will need to be added in the configuration unless the extra modules can be added to an existing powered backplane. For further reference, see *Power Supply Capacities in Remote Drop Secondary Applications*, [page 623](#) and *I/O Module Current Requirements*, [page 624](#).

Secondary backplanes AS-H819-100 and AS-H827-100 support 7 and 11 I/O modules, respectively. Subtract two modules if power supplies need to be added.

### Backplane Interconnection Cables

See *Backplane Interconnection Diagrams*, [page 620](#) for appropriate configurations.

### ASCII Port Pinout Comparison

The following table shows how the ASCII port pinouts are used on the J892 and ASP890300.

| Terminal | J892 (25 pin) | ASP890300 (9 pin) |
|----------|---------------|-------------------|
| 1        | Shield        | Not Used          |
| 2        | TXD           | RXD               |
| 3        | RXD           | TXD               |
| 4        | RTS           | DTR               |
| 5        | CTS           | SGND              |
| 6        | DSR           | DSR               |
| 7        | Ground        | RTS               |
| 8        | Not Used      | CTS               |
| 20       | DTR           | N/A               |

- The ASP890300 connector shell is chassis ground.

### Coaxial Cable Interconnection/Terminations

AS-J89X-00X Remote I/O Adapters - These have BNC type connectors which are not compatible with the F style connections on ASP890300 modules. Installers may use BNC Jack to Male "F" Connector Adapters, part number 52-0724-000. The external 75Ω terminator added in series with the coax drop cable must be removed as the ASP890300 is terminated internally.

AS-J890-10X Remote I/O Adapters are compatible in this respect. They have "F" type coaxial cable connectors and are terminated internally.

## Replacement of AS-J81X-000 Adapters

### Overview

**NOTE:** You are reminded the ASP890300 is not compatible with J200 or S901 RIO heads that communicate with J810/J812 modules. Use of the ASP890300 requires the use of an S908 or CRP type RI/O head.

The ASP890300 is not physically compatible if installations use the following adapter models:

|             |             |
|-------------|-------------|
| AS-J810-000 | AS-J812-000 |
|-------------|-------------|

In these installations, you will need to:

- replace the primary backplanes ( housings)
- perform power calculations to determine if additional supplies are needed (see *I/O Module Current Requirements*, [page 624](#))
- consider backplane interconnection cables
- review ASCII Port and coaxial cable connections

### Primary Backplane Replacement

ASP890300 modules are compatible with:

- AS-H810-208 (10", ASP890300 plus three I/O modules)\*
- AS-H810-209 (10", ASP890300 plus three I/O modules)\*
- AS-H819-209 (19", ASP890300 plus six I/O modules)
- AS-H827-209 (27", ASP890300 plus ten I/O modules)

\*Repair/service exchange only.

### Power Considerations

If the primary backplane power requirements exceed the ASP890300 capabilities, enough I/O modules must be removed from the primary backplane to bring the current load within specified limits. In this case, an additional backplane and power supply will need to be added in the configuration unless the extra modules can be added to an existing powered backplane. For further reference, see *Power Supply Capacities in Remote Drop Secondary Applications*, [page 623](#) and *I/O Module Current Requirements*, [page 624](#).

Secondary backplanes AS-H819-100 and AS-H827-100 support 7 and 11 I/O modules, respectively. Subtract two modules if power supplies need to be added.

### Backplane Interconnection Cables

See *Backplane Interconnection Diagrams*, [page 620](#) for appropriate configurations.

### ASCII Port Pinout Comparison

The following table shows how the ASCII port pinouts are used on the J812 and ASP890300.

| Terminal | J812 (25 pin) | ASP890300 (9 pin) |
|----------|---------------|-------------------|
| 1        | GND           | Not Used          |
| 2        | TXD           | RXD               |
| 3        | RXD           | TXD               |
| 4        | RTS           | DTR               |
| 5        | CTS           | SGND              |
| 6        | DSR           | DSR               |
| 7        | SGND          | RTS               |
| 8        | Not Used      | CTS               |
| 20       | DTR           | N/A               |

- The ASP890300 connector shell is chassis ground.

### Coaxial Cable Interconnection/Terminations

These have BNC type connectors which are not compatible with the F style connections on ASP890300 modules. Unless otherwise accommodated, installers may use BNC Jack to Male "F" Connector Adapters, part number 52-0724-000.

## Replacement of Slot Mount PLCs

### Compatibility

The ASP890300 is backplane compatible with Slot Mount PLC installations. These include:

- PC-0984-380/1/5; PC-E984-381/5
- PC-0984-480/5; PC-E984-480/5
- PC-0984-680/5; PC-E984-685
- PC-0984-780/5; PC-E984-785

### AC Power Connector Rewiring

Rewiring is required to accommodate one 2 terminal and one 3 terminal connector, which include a 115/230VAC jumper selection option as opposed to the switch selectable option in the original units. Rewiring requires a small slotted screwdriver.

## DANGER

### ELECTRIC SHOCK

Connect the module grounding terminal to the protective ground, using a green/yellow wire.

**Failure to follow these instructions will result in death or serious injury.**

### Power Considerations

**If replacing high end slot mount PLCs:** Both +5VDC I/O power and the Combined load in PC-0984-680/5s and PC-0984-780/5s are rated 1A higher than the ASP890300. If the Primary backplane power requirements exceed the ASP890300 capabilities, enough I/O modules must be removed from the primary backplane to bring the current load within specified limits. In this case, an additional backplane and power supply will need to be added in the configuration unless the extra modules can be added to an existing powered backplane. See *I/O Module Current Requirements*, [page 624](#) and *Power Supply Capacities in Remote Drop Secondary Applications*, [page 623](#).

Secondary backplanes AS-H819-100 and AS-H827-100 support 7 and 11 I/O modules, respectively. Subtract two modules if power supplies need to be added.

### Backplane Interconnection Cables

For more information, see *Backplane Interconnection Diagrams*, [page 620](#)

# Appendix B

## ASP890300 Executive Software Reflash

---

### Purpose

The purpose of this chapter is to provide guidelines for reflash of executive software used in the processor. Executive software can be obtained on the Schneider web site at

[www.schneiderautomation.com](http://www.schneiderautomation.com)

by selecting the appropriate Firmware location.

The ASP890300 executive software is resident in flash RAM and may be updated as required. Reflash requires a PC with an available serial port and loaded with Schneider panel software. Concept contains utilities that may be used. Versions of ProWORX and Modsoft that support 800 series I/O contain reflash utilities.

### What Is in This Chapter?

This chapter contains the following topics:

| Topic                    | Page |
|--------------------------|------|
| Interconnection          | 628  |
| Communication Parameters | 629  |
| Procedure                | 630  |

## Interconnection

### Cables

Cables that may be used to connect the panel PC serial port to the ASP890300 ASCII port 1 are:

- AS-W952-012 Programming Cable, 12'
- 990NAA26320 Programming Cable, 12'
- 990NAA26350 Programming Cable, 50'

## Communication Parameters

### RTU and ASCII Mode

Communication parameters for RTU and ASCII modes are shown here:

|            |                                                 |
|------------|-------------------------------------------------|
| RTU Mode   | 9600 baud, 8 data bits, Even parity, 1 stop bit |
| ASCII Mode | 9600 baud, 7 data bits, Even parity, 1 stop bit |

## Procedure

### ASP890300 Executive Reflash Procedure

Use the following procedure to reflash the ASP890300 executive software.

| Step | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | At a time when system operation can be interrupted, turn off power to the ASP890300 and other supplies in the affected drop. Ensure the ASP890300 front panel power switches are in the OFF position.                                                                                                                                                                                                                                                                                                                                                                                               |
| 2    | Remove module from the backplane. Note the position of the MODE SELECT switch. The switch should be returned to that position when the reflash sequence has been completed. Set the MODE SELECT switch to position 7 (RTU mode) or 8 (ASCII mode)                                                                                                                                                                                                                                                                                                                                                   |
| 3    | Connect a communication cable from the panel software PC serial port to the ASP890300 ASCII Port 1 ONLY. Port 2 is not supported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 4    | The module may be reinserted into the system backplane and powered. It may also be flashed on the bench, e.g. plugged into a spare non-system backplane and powered on.<br>After power is turned on, the Comm Active LED (third from the top) will blink 9 times, then pause, blink 9 times and pause, etc. This indicates the module is in kernel mode and ready to be flashed.                                                                                                                                                                                                                    |
| 5    | In panel software, display the exec download menu.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 6    | Use the <b>Direct MB Device</b> selection. The address used should be that selected by the ASP890300 address rotary switches. If connected to a Modbus network, insure there are no address conflicts. Set the communication parameters to those listed above per the mode selection, either RTU or ASCII, and perform the normal executive software loading procedure.                                                                                                                                                                                                                             |
| 7    | After the transfer is complete, the panel software will indicate a timeout error, and there will be no further communication to the P890. Look at the ASP890300 LEDs for confirmation that the flash sequence has succeeded. When an exec download has successfully completed, the front panel LEDs will repeatedly blink in the same sequence from top to bottom as that following a power up. If the operation fails, the Comm Active LED will continue to flash as noted in Step 4.<br><b>NOTE:</b> Some versions of the built-in exec loader in ProWORX may lock up at the end of the transfer. |
| 8    | Power down the ASP890300.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 9    | Unplug the programming cable from the ASCII Port. Remove the module from its backplane. Set the MODE SELECT switch back to the correct position (noted in Step 2).                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 10   | Insert the ASP890300 into the rack. Turn on power to it and other supplies as required. The ASP890300 should operate normally.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

---

# Appendix C

## CE Requirements for ASP890300/800 Series I/O Systems

---

### Purpose

This chapter covers the installation requirements necessary to maintain compliance with the European Directive for EMC 89/336/EEC for certain 800 Series I/O system components. The majority of 800 Series I/O components are approved per these requirements; however, examine your particular product/shipping carton for the CE mark to ensure approval.

### What Is in This Chapter?

This chapter contains the following topics:

| Topic                                                              | Page |
|--------------------------------------------------------------------|------|
| Requirements—800 Series I/O Modules with Control Expert            | 632  |
| CE Installation—800 Series I/O Modules with Control Expert         | 633  |
| Installation Parts List—800 Series I/O Modules with Control Expert | 634  |

## Requirements—800 Series I/O Modules with Control Expert

### Requirements List

The following requirements should be followed for installations complying with the CE marking.

| Requirement for            | Description                                                                                                                                                                                                                                                                                                               |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Power supply and I/O lines | All wiring for power supply and I/O lines must be in grounded steel conduits (EMT) or must use braided shielded cable.<br>If shielded cable is used, the braid must have 80% or more shield coverage, and the outside diameter of the braid (without jacket) must be in the range of 0.189 ... 0.237 in (4.8 ... 6.0 mm). |
| Cable shields              | All cable shields must be grounded, using clips on the Grounding Bar (part number CER001).<br>Shield is not terminated at module field connector.                                                                                                                                                                         |
| Grounding                  | Install braided earth ground to both <ul style="list-style-type: none"><li>● grounding clip (or clips as required)</li><li>● backplane ground reference</li></ul>                                                                                                                                                         |
| Line filters               | Use a 110/220 Vac Line Filter (Schaffner part number FN670-30/6).<br>Install as shown in the AC power input figure.                                                                                                                                                                                                       |

## CE Installation—800 Series I/O Modules with Control Expert

### Remote Drop Example

The following graphics show the correct CE installation for a remote drop.

**Typical CE Installation for a Remote Drop**

## Installation Parts List—800 Series I/O Modules with Control Expert

### Manufacturers Part Numbers/Instructions

| Callout | Vendor    | Part Number                          | Description                                                                                                                                                                                                                                                              | Instructions                                                                                          |
|---------|-----------|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------|
| 1       | Schaffner | FN670-3/06                           | Line Filter (Fast on terminals)<br><b>Dimensions:</b><br>Length: 3.4 in (85 mm)<br>Width: 2.2 in (55 mm)<br>Height: 1.6 in (40 mm)<br><b>Mounting Holes:</b><br>0.2 in (5.3 mm) dia.<br>3 in (75 mm) centerline mounted<br><b>Fast on Terminals:</b><br>0.25 in (6.4 mm) | Install next to the 984 CPU.                                                                          |
| 2       | Schneider | CER001 or equivalent                 | Grounding Bar                                                                                                                                                                                                                                                            | All cable shields must be grounded. <b>NOTE:</b> Not required if using steel conduit.                 |
| 3       |           |                                      | Flat Ground Braided Cable                                                                                                                                                                                                                                                |                                                                                                       |
| 4       | Oflex     | 35005<br>3 conductor<br>100cy Series | Shielded Cable<br>maximum length: 30 in (760 mm)                                                                                                                                                                                                                         | The shield is terminated at the EMI Line Filter and open at CPU end. The third conductor is not used. |
| 5       | Oflex     | 35005<br>3 conductor<br>100cy Series | Shielded Cable                                                                                                                                                                                                                                                           | Terminate the shield at panel ground, at EMI Filter.                                                  |
